GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a

Name	Description
	timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexApplication Class

Description
A default, or Application, container that lets you start adding content to your application without explicitly defining another container.

Inheritance Hierarchy
- *FlexContainer*
  - FlexApplication
    - *FlexWindowedApplication*

Syntax
```
'Declaration
Public Class FlexApplication _
Inherits FlexContainer
```

Properties
Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)

Name	Description
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
url	the URL from which this Application's SWF file was loaded.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexAreaChart Class

Description

Represents data as an area bounded by a line connecting the values in the data. The AreaChart control can be used to represent different variations, including simple areas, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexAreaChart

Syntax

```
'Declaration
Public Class FlexAreaChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)

Name	Description
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)

Name	Description
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexAreaSeries Class

Description
Defines a data series for an AreaChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexAreaSeries

Syntax

```
'Declaration
Public Class FlexAreaSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
form	the boundary type for the area.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
minField	the field of the dataProvider that determines the bottom boundary of the area.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)

Name	Description
radius	the radius, in pixels, of the chart elements for the data points.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the position of the data points on the horizontal axis.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yField	the field of the data provider that determines the position of the data point on the vertical axis.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexAxisRenderer Class

Description

Describe the horizontal and vertical axes of a chart. An axis is responsible for rendering the labels, tick marks, and title along its length.

AxisRenderer objects inherit some of their visual properties from the enclosing chart object. The text format of the labels and title defaults to the CSS text properties of the renderer. You can control the formatting of the axis title separately by specifying a axisTitleStyleName, either on the AxisRenderer or on the enclosing chart.

Inheritance Hierarchy

- *FlexObject*
  - FlexAxisRenderer

Syntax

```
'Declaration
Public Class FlexAxisRenderer _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
canDropLabels	whether the AxisRenderer should drop labels as necessary to lay out correctly.
canStagger	whether to stagger labels on two label rows. Use this setting to minimize the space required for the labels. The default value is true, which staggers the labels.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
heightLimit	the maximum amount of space, in pixels, that an axis renderer will take from a chart.
id	the ID of the component. (Inherited from *FlexObject*)
labelGap	the gap between the end of the tick marks and the top of the labels, in pixels. The default value is 3.
labelRotation	the label rotation.
lastVisibleRow	the index of the last visible child.
length	the length of the axis, in screen coordinates.
minorTickLength	the length of the minor tick marks on the axis, in pixels. The default value is 0.
minorTickPlacement	a value where to draw the minor tick marks. Values include: *inside*, *outside*, *cross*, and *none*.
minorTicks	an array that specifies where Flex draws the minor tick marks along the axis. Each array element contains a value between 0 and 1.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
placement	the side of the chart that the axisRenderer appears on.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showLabels	whether labels appear along the axis. The default value is true.
showLine	whether to display the axis. The default value is true.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
tickLength	the length of the tick marks on the axis, in pixels. The default value is 3.
tickPlacement	a value where to draw the tick marks. Values include: *inside*, *outside*, *cross*, and *none*.
ticks	an array that specifies where Flex draws the tick marks along the axis. Each array element contains a value between 0 and 1.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexBarChart Class

Description
Represents data as a series of horizontal bars whose length is determined by values in the data. A BarChart control can represent different chart variations, including simple bars, clustered bars, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexBarChart

Syntax

```
'Declaration
Public Class FlexBarChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
barWidthRatio	how wide to draw the bars relative to the category width, as a percentage in the range of 0 to 1.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)

Name	Description
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maxBarWidth	how wide to draw the bars, in pixels.
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)

Name	Description
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexBarSeries Class

Description
Defines a data series for a BarChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexBarSeries

Syntax

```
'Declaration
Public Class FlexBarSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
barWidthRatio	the width to render the bars relative to the category width.

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxBarWidth	the width of the bars, in pixels.
minField	the field of the data provider that determines the bottom of each bar.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
offset	the amount to offset the center of the bars from the center of the available space, relative to the category width.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of the top of each bar.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
yField	the field of the data provider that determines the y-axis location of the bottom of each bar in the chart.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexBox Class

Description
A Box container lays out its children in a single vertical column or a single horizontal row.

Inheritance Hierarchy

- *FlexContainer*
  - FlexBox
    - *FlexDividedBox*
    - *FlexNavigationBar*

Syntax

```
'Declaration
Public Class FlexBox _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container.
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexBubbleChart Class

Description

Represents data with three values for each data point. Each data point is defined by a value determining its position along the horizontal axis, a value determining its position along the vertical axis, and a value determining the size of the chart element, relative to the other data points on the chart.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexBubbleChart

Syntax

```
'Declaration
Public Class FlexBubbleChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)

Name	Description
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to

Name	Description
	false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)

Name	Description
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexBubbleSeries Class

Description
Defines a data series for a BubbleChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexBubbleSeries

Syntax

```
'Declaration
Public Class FlexBubbleSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxRadius	The radius of the largest item renderered in this series.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
radiusField	the field of the data provider that determines the radius of each symbol, relative to the other data points in the chart.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of each data point.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yField	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexButton Class

Description

The Button control is a commonly used rectangular button. Button controls look like they can be pressed. They can have a text label, an icon, or both on their face.

Buttons typically use event listeners to perform an action when the user selects the control. When a user clicks the mouse on a Button control, and the Button control is enabled, it dispatches a click event and a buttonDown event. A button always dispatches events such as the mouseMove, mouseOver, mouseOut, rollOver, rollOut, mouseDown, and mouseUp events whether enabled or disabled.

You can customize the look of a Button control and change its functionality from a push button to a toggle button. You can change the button appearance by using a skin for each of the button's states.

The label of a Button control uses a bold typeface. If you embed a font that you want to use for the label of the Button control, you must embed the bold typeface.

Inheritance Hierarchy

- *FlexObject*
  - FlexButton
    - *FlexCheckBox*
    - *FlexPopUpButton*
    - *FlexRadioButton*

Syntax

```
'Declaration
Public Class FlexButton _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls.
fillColors	the colors used to tint the background of the control.
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the Button control.
labelPlacement	the orientation of the label in relation to a specified icon.

Name	Description
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether a toggle button is toggled on (true) or off (false).
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container.
textDecoration	whether the text is underlined.
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C.
textSelectedColor	the text color of the label as the user presses it. The default value is 0x000000.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toggle	whether a Button is in a toggle state or not.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexButtonBar Class

Description
Defines a horizontal or vertical group of logically related push buttons with a common look and navigation.

Inheritance Hierarchy

- *FlexNavigationBar*
  - FlexButtonBar
    - *FlexToggleButtonBar*

Syntax

```
'Declaration
Public Class FlexButtonBar _
Inherits FlexNavigationBar
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout. (Inherited from *FlexBox*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container. (Inherited from *FlexBox*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to

Name	Description
	false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from *FlexNavigationBar*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container. (Inherited from *FlexBox*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Defines the value of the type property of the event object for an itemClick event. (Inherited from *FlexNavigationBar*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexNavigationBar*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexCandlestickChart Class

Description

Represents financial data as a series of candlesticks representing the high, low, opening, and closing values of a data series.

The top and bottom of the vertical line in each candlestick represent the high and low values for the datapoint, while the top and bottom of the filled box represents the opening and closing values. Each candlestick is filled differently depending on whether the closing value for the datapoint is higher or lower than the opening value.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexCandlestickChart

Syntax

```
'Declaration
Public Class FlexCandlestickChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
columnWidthRatio	a ratio of how wide to draw the candlesticks relative to the horizontal axis's category widths, as a percentage in the range of 0 to 1.
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)

Name	Description
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maxColumnWidth	how wide to draw the candlesticks, in pixels.
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)

Name	Description
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexCandlestickSeries Class

Description

Represents financial data as a series of candlesticks representing the high, low, opening, and closing values of a data series.

The top and bottom of the vertical line in each candlestick represent the high and low values for the datapoint, while the top and bottom of the filled box represent the opening and closing values. Each candlestick is filled differently depending on whether the closing value for the datapoint is higher or lower than the opening value.

Inheritance Hierarchy

- *FlexHLOCSeriesBase*
  - FlexCandlestickSeries

Syntax

```
'Declaration
Public Class FlexCandlestickSeries _
Inherits FlexHLOCSeriesBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
columnWidthRatio	the width of elements relative to the category width. (Inherited from *FlexHLOCSeriesBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxColumnWidth	the width of the elements, in pixels. (Inherited from *FlexHLOCSeriesBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)

Name	Description
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of the element. (Inherited from *FlexHLOCSeriesBase*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexCanvas Class

Description

A Canvas layout container defines a rectangular region in which you place child containers and controls. It is the only container that lets you explicitly specify the location of its children within the container by using the x and y properties of each child.

Flex sets the children of a Canvas layout container to their preferred width and preferred height. You may override the value for a child's preferred width by setting its width property to either a fixed pixel value or a percentage of the container size. You can set the preferred height in a similar manner.

If you use percentage sizing inside a Canvas container, some of your components may overlap. If this is not the effect you want, plan your component positions and sizes carefully.

Inheritance Hierarchy

- *FlexContainer*
  - FlexCanvas

Syntax

```
'Declaration
Public Class FlexCanvas _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)

Name	Description
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexCartesianChart Class

Description
A base class for the common chart types. CartesianChart defines the basic layout behavior of the standard rectangular, two-dimensional charts.

Inheritance Hierarchy

- *FlexChart*
  - FlexCartesianChart
    - *FlexAreaChart*
    - *FlexBarChart*
    - *FlexBubbleChart*
    - *FlexCandlestickChart*
    - *FlexColumnChart*
    - *FlexHLOCChart*
    - *FlexLineChart*
    - *FlexPlotChart*

Syntax

```
'Declaration
Public Class FlexCartesianChart _
Inherits FlexChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)

Name	Description
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control.
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control.
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control.
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis.
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to

Name	Description
	false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)

Name	Description
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAxisRatio	the width limit of the vertical axis.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexChart Class

Description

The link between the Flex component architecture and the DualStyleObject architecture. It extends the Flex UIComponent base class, but contains DualStyleObject classes.

You typically do not use the ChartBase class directly. Instead you use one of its subclasses, such as PlotChart or BubbleChart. It acts as the base class for the common chart types provided in the mx.charts package.

This class defines a number of CSS styles and properties that provide easy access to the more common features of the framework.

A chart's minimum size is 20 x 20 pixels. A chart's maximum size is unbounded. A chart's preferred size is 400 x 400 pixels.

Inheritance Hierarchy

- *FlexObject*
  - FlexChart
    - *FlexCartesianChart*
    - *FlexPieChart*

Syntax

```
'Declaration
Public Class FlexChart _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered.
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart.
description	a short description of the data in the chart.
dragEnabled	whether you can drag items out of this chart and drop them on other controls.
dropEnabled	whether dragged items can be dropped onto the chart.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
maximumDataTipCount	the maximum number of datatips a chart will show.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
paddingBottom	the number of pixels between the chart's bottom border and its content area.
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2.
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0.
paddingTop	the number of pixels between the chart's top border and its content area.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item.
selectedChartItems	an array of all the selected ChartItem objects in the chart.
selectionMode	whether ChartItem objects can be selected.
showDataTips	whether DataTip controls for the chart show.
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event.
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
DragStart	Defines the value of the type property of the event object for a dragStart event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexChartLegend Class

Description
Adds a legend to your charts, where the legend displays the label for each data series in the chart and a key showing the chart element for the series.

Inheritance Hierarchy

- *FlexObject*
  - FlexChartLegend

Syntax

```
'Declaration
Public Class FlexChartLegend _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text that displays next to the legend element.
labelPlacement	the label placement of the legend element. Valid values include: *top*, *bottom*, *right*, and *left*.
lastVisibleRow	the index of the last visible child.
markerAspectRatio	the aspect ratio for the marker associated with this legend item.
markerHeight	the height of the legend element.
markerWidth	the width of the legend element.

Name	Description
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2.
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
verticalGap	the number of pixels between children in the vertical direction. The default value depends on the component class; if not overriden for the class, the default value is 6.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LegendItemClick	Dispatched when the user clicks on a LegendItem in the Legend control, which indicates that the user clicked the mouse button over a legend item.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexChartSeries Class

Description

The base class for the classes that let you specify a data series for a chart control.

You use the subclasses of the Series class with the associated chart control. You can use a Series class to specify the fill pattern and stroke characteristics for the chart elements that are associated with the data series.

Inheritance Hierarchy

- *FlexObject*
  - FlexChartSeries
    - *FlexAreaSeries*
    - *FlexBarSeries*
    - *FlexBubbleSeries*
    - *FlexColumnSeries*
    - *FlexHLOCSeriesBase*
    - *FlexLineSeries*
    - *FlexPieSeries*
    - *FlexPlotSeries*

Syntax

```
'Declaration
Public Class FlexChartSeries _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series.

Name	Description
selectedIndices	an array of indexes of the selected items in the data provider of the series.
selectedItem	the chart item that is selected in the series.
selectedItems	an array of chart items that are selected in the series.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart.
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart.
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexCheckBox Class

Description

The CheckBox control consists of an optional label and a small box that can contain a check mark or not.

You can place the optional text label to the left, right, top, or bottom of the CheckBox. When a user clicks a CheckBox control or its associated text, the CheckBox control changes its state from checked to unchecked or from unchecked to checked. CheckBox controls gather a set of true or false values that are not mutually exclusive.

Inheritance Hierarchy

- *FlexButton*
  - `FlexCheckBox`

Syntax

```
'Declaration
Public Class FlexCheckBox _
Inherits FlexButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from *FlexButton*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexButton*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexButton*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexButton*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexButton*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexButton*)
fontSize	the height of the text, in pixels. (Inherited from *FlexButton*)
fontStyle	whether the text is italic font. (Inherited from *FlexButton*)
fontWeight	whether the text is boldface. (Inherited from *FlexButton*)

Name	Description
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the Button control. (Inherited from *FlexButton*)
labelPlacement	the orientation of the label in relation to a specified icon. (Inherited from *FlexButton*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether a toggle button is toggled on (true) or off (false). (Inherited from *FlexButton*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexButton*)
textDecoration	whether the text is underlined. (Inherited from *FlexButton*)
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexButton*)

Name	Description
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexButton*)
textSelectedColor	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from *FlexButton*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toggle	whether a Button is in a toggle state or not. (Inherited from *FlexButton*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexButton*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexColorPicker Class

Description

Provides a way for a user to choose a color from a swatch list.

The default mode of the component shows a single swatch in a square button. When the user clicks the swatch button, the swatch panel appears and displays the entire swatch list.

Inheritance Hierarchy

- *FlexComboBase*
  - FlexColorPicker

Syntax

```
'Declaration
Public Class FlexColorPicker _
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from *FlexComboBase*)
backgroundColor	the background color of a component. (Inherited from *FlexComboBase*)
backgroundImage	the background image of a component. (Inherited from *FlexComboBase*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexComboBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. (Inherited from *FlexComboBase*)
columnCount	the number of columns in the swatch grid. The default value is 20.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the background color of the component when it is disabled. (Inherited from *FlexComboBase*)
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from *FlexComboBase*)
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider. (Inherited from *FlexComboBase*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexComboBase*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexComboBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexComboBase*)
fontSize	the height of the text, in pixels. (Inherited from *FlexComboBase*)
fontStyle	whether the text is italic font. (Inherited from *FlexComboBase*)

Name	Description
fontWeight	whether the text is boldface. (Inherited from *FlexComboBase*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
highlightColor	the highlight color of the drop-down list. (Inherited from *FlexComboBase*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can or cannot enter into the text field. (Inherited from *FlexComboBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedColor	the value of the currently selected color in the SwatchPanel object.
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexComboBase*)
showTextField	whether to show the text box that displays the color label or hexadecimal color value. The default value is true.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the contents of the text field. (Inherited from *FlexComboBase*)
textAlign	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from *FlexComboBase*)

Name	Description
textDecoration	whether the text is underlined. (Inherited from *FlexComboBase*)
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexComboBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the selected color changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Defines the value of the type property of the event object for a close event. (Inherited from *FlexComboBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from *FlexComboBase*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Defines the value of the type property of the event object for a open event. (Inherited from *FlexComboBase*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexComboBase*)
SelectText	Lets you track selection within a text field. (Inherited from *FlexComboBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexComboBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexColumnChart Class

Description

Represents data as a series of vertical columns whose height is determined by values in the data.

You can use the ColumnChart to represent a variety of different charts including simple columns, clustered columns, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexColumnChart

Syntax

```
'Declaration
Public Class FlexColumnChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
columnWidthRatio	a ratio of wide to draw the columns relative to the category width, as a percentage in the range of 0 to 1.
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)

Name	Description
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maxColumnWidth	how wide to draw the columns, in pixels.
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)

Name	Description
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexColumnSeries Class

Description
Defines a data series for a ColumnChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexColumnSeries

Syntax

```
'Declaration
Public Class FlexColumnSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
columnWidthRatio	the width of columns relative to the category width.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxColumnWidth	the width of the columns, in pixels.
minField	the field of the data provider that determines the y-axis location of the bottom of a column.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
offset	how far to offset the center of the columns from the center of the available space, relative to the category width.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
sortOnXField	whether the columns are sorted from left to right before rendering.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of the column.

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yField	the field of the data provider that determines the y-axis location of the top of a column.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)

Name	Description
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexComboBase Class

Description

The base class for controls that display text in a text field and have a button that causes a drop-down list to appear where the user can choose which text to display.

Inheritance Hierarchy

- *FlexObject*
  - FlexComboBase
    - *FlexColorPicker*
    - *FlexComboBox*
    - *FlexDateField*

Syntax

```
'Declaration
Public Class FlexComboBase _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style.
backgroundColor	the background color of a component.
backgroundImage	the background image of a component.
backgroundSize	the percentage to change the image size to for the specified backgroundImage.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label.

Name	Description
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the background color of the component when it is disabled.
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true.
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls.
fillColors	the colors used to tint the background of the control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
highlightColor	the highlight color of the drop-down list.
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can or cannot enter into the text field.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index in the data provider of the selected item.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the contents of the text field.
textAlign	the alignment of text within a container. Possible values are:left, right, or center.
textDecoration	whether the text is underlined.
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Defines the value of the type property of the event object for a close event.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Defines the value of the type property of the event object for a open event.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event.
SelectText	Lets you track selection within a text field.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexComboBox Class

Description

Contains a drop-down list from which the user can select a single value.

The ComboBox can be editable, in which case the user can type entries into the TextInput portion of the ComboBox that are not in the list.

Inheritance Hierarchy

- *FlexComboBase*
  - FlexComboBox

Syntax

```
'Declaration
Public Class FlexComboBox _
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the set of BackgroundColors for drop-down list rows in an alternating pattern.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from *FlexComboBase*)
backgroundColor	the background color of a component. (Inherited from *FlexComboBase*)
backgroundImage	the background image of a component. (Inherited from *FlexComboBase*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexComboBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. (Inherited from *FlexComboBase*)
columnNames	a list containing the names of all columns in the data.

Name	Description
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the background color of the component when it is disabled. (Inherited from *FlexComboBase*)
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from *FlexComboBase*)
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider. (Inherited from *FlexComboBase*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexComboBase*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexComboBase*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexComboBase*)
fontSize	the height of the text, in pixels. (Inherited from *FlexComboBase*)
fontStyle	whether the text is italic font. (Inherited from *FlexComboBase*)
fontWeight	whether the text is boldface. (Inherited from *FlexComboBase*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
highlightColor	the highlight color of the drop-down list. (Inherited from *FlexComboBase*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can or cannot enter into the text field. (Inherited from *FlexComboBase*)
rollOverColor	the rollOverColor of the drop-down list.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexComboBase*)
selectionColor	the selectionColor of the drop-down list.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the contents of the text field. (Inherited from *FlexComboBase*)
textAlign	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from *FlexComboBase*)
textDecoration	whether the text is underlined. (Inherited from *FlexComboBase*)
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexComboBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Defines the value of the type property of the event object for a close event. (Inherited from *FlexComboBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from *FlexComboBase*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Defines the value of the type property of the event object for a open event. (Inherited from *FlexComboBase*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexComboBase*)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectText	Lets you track selection within a text field. (Inherited from *FlexComboBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexComboBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexContainer Class

Description

An abstract base class for components that controls the layout characteristics of child components.

You do not create an instance of Container in an application. Instead, you create an instance of one of Container's subclasses, such as Canvas or HBox.

The Container class contains the logic for scrolling, clipping, and dynamic instantiation. It contains methods for adding and removing children and the logic for drawing the background and borders of containers.

Inheritance Hierarchy

- *FlexObject*
  - FlexContainer
    - *FlexAccordion*
    - *FlexApplication*
    - *FlexBox*
    - *FlexCanvas*
    - *FlexForm*
    - *FlexFormItem*
    - *FlexPanel*
    - *FlexViewStack*
    - *FlexWindow*

Syntax

```
'Declaration
Public Class FlexContainer _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0.
backgroundColor	the background color of a component.
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined.
backgroundImage	the background image of a component. This can be an absolute or relative URL or class.
backgroundSize	the percentage to change the image size to for the specified backgroundImage.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
creationIndex	the order to instantiate and draw the children of the container.
creationPolicy	the child creation policy for this Container.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components.
fillColors	the colors used to tint the background fill of the component.
firstVisibleRow	the index of the first visible child.

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container.
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container.
numColumns	the total number of columns of data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event.
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
DragStart	Defines the value of the type property of the event object for a dragStart event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexContainerMovieClip Class

Description

Container components created in Adobe Flash CS3 Professional for use in Flex are subclasses of the mx.flash.ContainerMovieClip class.

You can use a subclass of ContainerMovieClip as a Flex container, it can hold children, and it can respond to events, define view states and transitions, and work with effects in the same way as can any Flex component.

A Flash container can only have a single Flex child. However, this child can be a Flex container which allows you to add additional children.

Inheritance Hierarchy

- *FlexUIMovieClip*
  - FlexContainerMovieClip

Syntax

```
'Declaration
Public Class FlexContainerMovieClip _
Inherits FlexUIMovieClip
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexUIMovieClip*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexUIMovieClip*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexUIMovieClip*)
className	the name of this instance's class, such as "Button". (Inherited from *FlexUIMovieClip*)
currentState	the current state of this component. (Inherited from *FlexUIMovieClip*)
enabled	whether a movie clip is enabled. (Inherited from *FlexUIMovieClip*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexUIMovieClip*)
errorString	the text that is displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexUIMovieClip*)
focusEnabled	whether the component can receive focus when selected. (Inherited from *FlexUIMovieClip*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexUIMovieClip*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexUIMovieClip*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. Valid values are 0 to 100. (Inherited from *FlexUIMovieClip*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Valid values are 0 to 100. (Inherited from *FlexUIMovieClip*)
scaleX	the horizontal scale (percentage) of the object as applied from the registration point. The default registration point is (0,0). 1.0 equals 100% scale. (Inherited from *FlexUIMovieClip*)

Name	Description
scaleY	the vertical scale (percentage) of an object as applied from the registration point of the object. The default registration point is (0,0). 1.0 is 100% scale. (Inherited from *FlexUIMovieClip*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexUIMovieClip*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexUIMovieClip*)
useHandCursor	whether the pointing hand (hand cursor) appears when the mouse rolls over a sprite in which the buttonMode property is set to true. (Inherited from *FlexUIMovieClip*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Defines the value of the type property of a keyFocusChange event object. (Inherited from *FlexUIMovieClip*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Called by the FocusManager when the component receives focus. The component may in turn set focus to an internal component. (Inherited from *FlexUIMovieClip*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexDataGrid Class

Description

The DataGrid control is like a List except that it can show more than one column of data making it suited for showing objects with multiple properties.

Inheritance Hierarchy

- *FlexListBase*
  - FlexDataGrid

Syntax

```
'Declaration
Public Class FlexDataGrid _
Inherits FlexListBase
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from *FlexListBase*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from *FlexListBase*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control. (Inherited from *FlexListBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexListBase*)
columnWidth	the width of the control's columns. (Inherited from *FlexListBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipField	the name of the field in the data provider items to display as the data tip. (Inherited from *FlexListBase*)
editable	whether the user can edit items in the data provider.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexListBase*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexListBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
headerColors	An array of two colors used to draw the header background gradient.
headerStyleName	the name of a CSS style declaration for controlling other aspects of the appearance of the column headers. The default value is *dataGridStyles*.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalGridLineColor	the color of the horizontal grid lines.
horizontalGridLines	whether to show horizontal grid lines between the rows.

Name	Description
iconField	the name of the field in the data provider object that determines what to display as the icon. (Inherited from *FlexListBase*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	the name of the field in the data provider items to display as the label. (Inherited from *FlexListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexListBase*)
lockedColumnCount	the index of the first column in the control that scrolls. (Inherited from *FlexListBase*)
lockedRowCount	the index of the first row in the control that scrolls. (Inherited from *FlexListBase*)
minColumnWidth	The minimum width of the columns, in pixels. If not NaN, the DataGrid control applies this value as the minimum width for all columns. Otherwise, individual columns can have their own minimum widths. The default value is NaN.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexListBase*)
numRows	the total number of rows of data available. (Inherited from *FlexListBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizableColumns	whether the user can change the size of the columns.
rollOverColor	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from *FlexListBase*)
rowCount	the number of rows to be displayed. (Inherited from *FlexListBase*)
rowHeight	the height of the rows in pixels. (Inherited from *FlexListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	whether the list shows selected items as selected. (Inherited from *FlexListBase*)
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexListBase*)
selectedIndices	an array of indices in the data provider of the selected items. (Inherited from *FlexListBase*)
selectedItem	a reference to the selected item in the data provider. (Inherited from *FlexListBase*)
selectedItems	an array of references to the selected items in the data provider. (Inherited from *FlexListBase*)
selectionColor	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from *FlexListBase*)
selectionDisabledColor	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from *FlexListBase*)
showDataTips	whether dataTips are displayed for text in the rows. (Inherited from *FlexListBase*)
sortableColumns	whether the user can sort the data provider items by clicking on a column header cell.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexListBase*)
textSelectedColor	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from *FlexListBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useRollOver	whether items are highlighted as the mouse rolls over them. (Inherited from *FlexListBase*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
variableRowHeight	whether the individual rows can have different height. (Inherited from *FlexListBase*)
verticalAlign	the vertical alignment of a renderer in a row. (Inherited from *FlexListBase*)
verticalGridLineColor	the color of the vertical grid lines. The default value is 0x666666.
verticalGridLines	whether to show vertical grid lines between the columns.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped. (Inherited from *FlexListBase*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
ColumnStretch	Dispatched when a user changes the width of a column, indicating that the amount of data displayed in that column may have changed.
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from *FlexListBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked

Name	Description
	the mouse over a visual item in the control. (Inherited from *FlexListBase*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexListBase*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexListBase*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexListBase*)
Edit	Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexListBase*)

Name	Description
HeaderClick	Dispatched when the user releases the mouse button on a column header to request the control to sort the grid contents based on the contents of the column.
HeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from *FlexListBase*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexListBase*)

Name	Description
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from *FlexListBase*)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexDateChooser Class

Description

Displays the name of a month, the year, and a grid of the days of the month, with columns labeled for the day of the week.

The user can select a date, a range of dates, or multiple dates. The control contains forward and back arrow buttons for changing the month and year.

You can let users select multiple dates, disable the selection of certain dates, and limit the display to a range of dates.

Inheritance Hierarchy

- *FlexObject*
  - FlexDateChooser

Syntax

```
'Declaration
Public Class FlexDateChooser _
Inherits FlexObject
```

Properties

Name	Description
allowDisjointSelection	whether non-contiguous selection is allowed in the DateChooser control.
allowMultipleSelection	whether multiple selection is allowed in the DateChooser control.
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
disabledDays	the days to disable in a week.
disabledRanges	the single and multiple days to disable.
displayedMonth	the month displayed in the DateChooser control.
displayedYear	the year displayed in the DateChooser control. The default value is the current year.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background of the control.
firstDayOfWeek	the number representing the day of the week to display in the first column of the DateChooser control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
headerColors	the colors of the band at the top of the DateChooser control. The default value is [0xE6EEEE, 0xFFFFFF].
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maxYear	the last year selectable in the control.
minYear	the first year selectable in the control.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that

Name	Description
	is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the highlight area of the date when the user holds the mouse pointer over a date in the DateChooser control. The default value is 0xE3FFD6.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedDate	the date as selected in the DateChooser control.
selectedRanges	the selected date ranges.
selectionColor	the color of the highlight area of the currently selected date in the DateChooser control. The default value is 0xCDFFC1.
showToday	whether today's date is highlighted in the DataChooser control.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	whether the text is boldface.
textDecoration	whether the text is underlined.
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
todayColor	the color of the highlight of today's date in the DateChooser control. The default value is 0x2B333.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yearNavigationEnabled	whether year navigation is enabled.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when a date is selected or changed.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollDate	The DateChooserEvent.SCROLL constant defines the value of the type property of the event object for a scrollevent.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexDateField Class

Description

A text field that shows the date with a calendar icon on its right side.

When the user clicks anywhere inside the bounding box of the control, a DateChooser control pops up and shows the dates in the month of the current date. If no date is selected, the text field is blank and the month of the current date is displayed in the DateChooser control.

Inheritance Hierarchy

- *FlexComboBase*
  - FlexDateField

Syntax

```
'Declaration
Public Class FlexDateField _
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from *FlexComboBase*)
backgroundColor	the background color of a component. (Inherited from *FlexComboBase*)

Name	Description
backgroundImage	the background image of a component. (Inherited from *FlexComboBase*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexComboBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. (Inherited from *FlexComboBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the background color of the component when it is disabled. (Inherited from *FlexComboBase*)
disabledDays	the days to disable in a week.
disabledRanges	the disabled single and multiple days.
displayedMonth	the month that is displayed in the DateChooser control.
displayedYear	the year that is displayed in the DateChooser control.
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from *FlexComboBase*)
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider. (Inherited from *FlexComboBase*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexComboBase*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexComboBase*)
firstDayOfWeek	the day of the week (0-6, where 0 is the first element of the dayNames Array) to display in the first column of the DateChooser control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexComboBase*)
fontSize	the height of the text, in pixels. (Inherited from *FlexComboBase*)
fontStyle	whether the text is italic font. (Inherited from *FlexComboBase*)
fontWeight	whether the text is boldface. (Inherited from *FlexComboBase*)

Name	Description
headerColors	the colors of the band at the top of the DateChooser control. The default value is [0xE6EEEE, 0xFFFFFF].
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
highlightColor	the highlight color of the drop-down list. (Inherited from *FlexComboBase*)
id	the ID of the component. (Inherited from *FlexObject*)
maxYear	the last year selectable in the control.
minYear	the first year selectable in the control.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can or cannot enter into the text field. (Inherited from *FlexComboBase*)
rollOverColor	the color of the highlight area of the date when the user holds the mouse pointer over a date in the DateChooser control. The default value is 0xE3FFD6.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedDate	the date as selected in the DateChooser control.
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexComboBase*)
showToday	the day highlighted in the DateChooser control.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)

Name	Description
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the contents of the text field. (Inherited from *FlexComboBase*)
textAlign	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from *FlexComboBase*)
textDecoration	whether the text is underlined. (Inherited from *FlexComboBase*)
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexComboBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
todayColor	the color of the highlight of today's date in the DateChooser control. The default value is 0x2B333.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yearNavigationEnabled	whether the year up and down buttons are available for navigation.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Change	Dispatched when a date is selected or changed, and the DateChooser control closes.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Defines the value of the type property of the event object for a close event. (Inherited from *FlexComboBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from *FlexComboBase*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Defines the value of the type property of the event object for a open event. (Inherited from *FlexComboBase*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexComboBase*)
ScrollDate	The DateChooserEvent.SCROLL constant defines the value of the type property of the event object for a scrollevent.
SelectText	Lets you track selection within a text field. (Inherited from *FlexComboBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexComboBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexDisplayObject Class

Description
The base class for all objects that can be placed on the display list. The display list manages all objects displayed in Flash Player or Adobe AIR.

Inheritance Hierarchy

- *TestObject*
  - FlexDisplayObject
    - *FlexListLabel*
    - *FlexObject*
    - *FlexUIMovieClip*

Syntax

```
'Declaration
Public Class FlexDisplayObject _
Inherits TestObject _
Implements IClickable, IKeyable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified.
height	the height of the display object, in pixels.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren.
tabChildren	whether the children of the display object are tab enabled. The default is true.
tabEnabled	whether this object is in the tab order.
tabIndex	the tab ordering of objects in a SWF file.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible.
width	the width of the display object, in pixels.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexDividedBox Class

Description

Measures and lays out its children horizontally or vertically in exactly the same way as a Box container, but it inserts draggable dividers in the gaps between the children. Users can drag any divider to resize the children on each side.

The *DividedBox* class is the base class for the *HDividedBox* and *VDividedBox* classes.

Inheritance Hierarchy

- *FlexBox*
  - FlexDividedBox

Syntax

```
'Declaration
Public Class FlexDividedBox _
Inherits FlexBox
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout. (Inherited from *FlexBox*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)

Name	Description
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container. (Inherited from *FlexBox*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeToContent	whether the DividedBox automatically resizes to the size of its children.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container. (Inherited from *FlexBox*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)

Name	Description
Dragged	Dispatched multiple times as the user drags any divider. The dividerDrag event is dispatched after the dividerPress event and before the dividerRelease event.
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Pressed	Dispatched when the user presses any divider in this container.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Released	Dispatched when the user releases a divider.
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexForm Class

Description
Use this class to control the layout of a form, mark form fields as required or optional, handle error messages, and bind your form data to the Flex data model to perform data checking and validation. This class also lets you use style sheets to configure the appearance of your forms.

Inheritance Hierarchy

- *FlexContainer*
  - FlexForm

Syntax

```
'Declaration
Public Class FlexForm _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexFormItem Class

Description
Defines a label and one or more children arranged horizontally or vertically. Children can be controls or other containers. A single Form container can hold multiple FormItem containers.

Inheritance Hierarchy

- *FlexContainer*
  - FlexFormItem

Syntax

```
'Declaration
Public Class FlexFormItem _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container.
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)

Name	Description
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexHLOCChart Class

Description

The HLOCChart (High Low Open Close) control represents financial data as a series of elements representing the high, low, closing, and optionally opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick represents the closing values, and the left tick represents the opening value if one was specified.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexHLOCChart

Syntax

```
'Declaration
Public Class FlexHLOCChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
columnWidthRatio	a ratio of how wide to draw the HLOC lines relative to the horizontal axis's category widths, as a percentage in the range of 0 to 1.
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)

Name	Description
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maxColumnWidth	how wide to draw the HLOC lines, in pixels.
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)

Name	Description
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexHLOCSeries Class

Description

Represents financial data as a series of elements representing the high, low, closing, and, optionally, opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick mark represents the closing value, and the left tick mark represents the opening value, if one was specified.

Inheritance Hierarchy

- *FlexHLOCSeriesBase*
  - FlexHLOCSeries

Syntax

```
'Declaration
Public Class FlexHLOCSeries _
Inherits FlexHLOCSeriesBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
columnWidthRatio	the width of elements relative to the category width. (Inherited from *FlexHLOCSeriesBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxColumnWidth	the width of the elements, in pixels. (Inherited from *FlexHLOCSeriesBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of the element. (Inherited from *FlexHLOCSeriesBase*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)

Name	Description
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexHLOCSeriesBase Class

Description

Represents financial data as a series of elements representing the high, low, closing, and, optionally, opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick mark represents the closing value, and the left tick mark represents the opening value, if one was specified.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexHLOCSeriesBase
    - *FlexCandlestickSeries*
    - *FlexHLOCSeries*

Syntax

```
'Declaration
Public Class FlexHLOCSeriesBase _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
columnWidthRatio	the width of elements relative to the category width.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)

Name	Description
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxColumnWidth	the width of the elements, in pixels.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)

Name	Description
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of the element.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexImage Class

Description

Lets you import JPEG, PNG, GIF, and SWF files at runtime.

You can also embed any of these files and SVG files at compile time by using @Embed(source='filename').

Note: Flex also includes the SWFLoader control for loading Flex applications. You typically use the Image control for loading static graphic files and SWF files, and use the SWFLoader control for loading Flex applications. The Image control is also designed to be used in custom item renderers and item editors.

Inheritance Hierarchy

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexLabel Class

Description
Displays a single line of noneditable text.

Inheritance Hierarchy

- *FlexObject*
  - FlexLabel

Syntax
```
'Declaration
Public Class FlexLabel _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
htmlText	the text displayed by the Label control, including HTML markup that expresses the styles of that text.
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the plain text displayed by this control. Its appearance is determined by the CSS styles of this Label control.
textAlign	the alignment of text within a container.
textDecoration	whether the text is underlined.
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexLineChart Class

Description

Represents a data series as points connected by a continuous line.

You can use an icon or symbol to represent each data point along the line, or show a simple line with no icons.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexLineChart

Syntax

```
'Declaration
Public Class FlexLineChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)

Name	Description
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)

Name	Description
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexLineSeries Class

Description
Defines a data series for a LineChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexLineSeries

Syntax

```
'Declaration
Public Class FlexLineSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
form	the line type for the chart.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
radius	the radius, in pixels, of the chart elements for the data points.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
sortOnXField	whether the line datapoints are sorted from left to right before rendering.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of each data point.

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yField	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)

Name	Description
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexLinkBar Class

Description

Defines a horizontal or vertical row of LinkButton controls that designate a series of link destinations.

You typically use a LinkBar control to control the active child container of a ViewStack container, or to create a stand-alone set of links.

Inheritance Hierarchy

- *FlexNavigationBar*
  - FlexLinkBar

Syntax

```
'Declaration
Public Class FlexLinkBar _
Inherits FlexNavigationBar
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout. (Inherited from *FlexBox*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container. (Inherited from *FlexBox*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from *FlexNavigationBar*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container. (Inherited from *FlexBox*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)

Name	Description
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Defines the value of the type property of the event object for an itemClick event. (Inherited from *FlexNavigationBar*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexNavigationBar*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexList Class

Description
Displays a list of items horizontally, verically, or laid out in tiles.

Inheritance Hierarchy

- *FlexListBase*
  - FlexList
    - *FlexTree*

Syntax
```
'Declaration
Public Class FlexList _
Inherits FlexListBase
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from *FlexListBase*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from *FlexListBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control. (Inherited from *FlexListBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexListBase*)
columnWidth	the width of the control's columns. (Inherited from *FlexListBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipField	the name of the field in the data provider items to display as the data tip. (Inherited from *FlexListBase*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexListBase*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexListBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
iconField	the name of the field in the data provider object that determines what to display as the icon. (Inherited from *FlexListBase*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	the name of the field in the data provider items to display as the label. (Inherited from *FlexListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexListBase*)
lockedColumnCount	the index of the first column in the control that scrolls. (Inherited from *FlexListBase*)
lockedRowCount	the index of the first row in the control that scrolls. (Inherited from *FlexListBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to

Name	Description
	false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexListBase*)
numRows	the total number of rows of data available. (Inherited from *FlexListBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from *FlexListBase*)
rowCount	the number of rows to be displayed. (Inherited from *FlexListBase*)
rowHeight	the height of the rows in pixels. (Inherited from *FlexListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	whether the list shows selected items as selected. (Inherited from *FlexListBase*)
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexListBase*)
selectedIndices	an array of indices in the data provider of the selected items. (Inherited from *FlexListBase*)
selectedItem	a reference to the selected item in the data provider. (Inherited from *FlexListBase*)
selectedItems	an array of references to the selected items in the data provider. (Inherited from *FlexListBase*)
selectionColor	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from *FlexListBase*)
selectionDisabledColor	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from *FlexListBase*)
showDataTips	whether dataTips are displayed for text in the rows. (Inherited from *FlexListBase*)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexListBase*)
textSelectedColor	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from *FlexListBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useRollOver	whether items are highlighted as the mouse rolls over them. (Inherited from *FlexListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
variableRowHeight	whether the individual rows can have different height. (Inherited from *FlexListBase*)
verticalAlign	the vertical alignment of a renderer in a row. (Inherited from *FlexListBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped. (Inherited from *FlexListBase*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from *FlexListBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from *FlexListBase*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexListBase*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexListBase*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexListBase*)
Edit	Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexListBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from *FlexListBase*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexListBase*)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from *FlexListBase*)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexListBase Class

Description

The ListBase class is the base class for controls that represent lists of items that can have one or more selected and can scroll through the items.

Items are supplied using the dataProvider property and displayed via item renderers.

In a model/view architecture, the ListBase-derived class represents the view, and the dataProvider object represents the model.

Inheritance Hierarchy

- *FlexScrollBase*
  - FlexListBase
    - *FlexAdvancedDataGrid*
    - *FlexDataGrid*
    - *FlexList*

Syntax

```
'Declaration
Public Class FlexListBase _
Inherits FlexScrollBase
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time.
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors to use for the backgrounds of the items in the list.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control.
columnNames	a list containing the names of all columns in the data.
columnWidth	the width of the control's columns.
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipField	the name of the field in the data provider items to display as the data tip.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
iconField	the name of the field in the data provider object that determines what to display as the icon.
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
labelField	the name of the field in the data provider items to display as the label.
lastVisibleRow	the index of the last visible child.
lockedColumnCount	the index of the first column in the control that scrolls.
lockedRowCount	the index of the first row in the control that scrolls.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6.
rowCount	the number of rows to be displayed.
rowHeight	the height of the rows in pixels.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	whether the list shows selected items as selected.
selectedIndex	the index in the data provider of the selected item.
selectedIndices	an array of indices in the data provider of the selected items.
selectedItem	a reference to the selected item in the data provider.
selectedItems	an array of references to the selected items in the data provider.
selectionColor	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF.
selectionDisabledColor	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD.
showDataTips	whether dataTips are displayed for text in the rows.

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C.
textSelectedColor	the color of the text of a renderer when the user selects it. The default value is 0x2B333C.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useRollOver	whether items are highlighted as the mouse rolls over them.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
variableRowHeight	whether the individual rows can have different height.
verticalAlign	the vertical alignment of a renderer in a row.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control.
DragCancel	Defines the value of the type property of the event object for a dragComplete event.
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
DragStart	Defines the value of the type property of the event object for a dragStart event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Scroll	Defines the value of the type property of the event object for a scroll event.
ScrollToIndex	Ensures that the data provider item at the given index is visible.
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexListLabel Class

Description
Defines the default item renderer for a control. By default, the item renderer draws the text associated with each item in the list, and an optional icon.

Inheritance Hierarchy

- *FlexDisplayObject*
  - FlexListLabel

Syntax

```
'Declaration
Public Class FlexListLabel _
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
automationValue	the value that generally corresponds to the rendered appearance of the object and should be usable for correlating the identifier with the object as it appears visually within the application.
className	the name of this instance's class, such as "Button".
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the

Name	Description
	mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexLoader Class

Description
Loads and displays a specified SWF file. You typically use SWFLoader for loading one Flex application into a host Flex application.

Inheritance Hierarchy

- *FlexObject*
  - FlexLoader
    - *FlexImage*

Syntax

```
'Declaration
Public Class FlexLoader _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
source	The URL, object, class or string name of a class to load as the content.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexMenu Class

Description
Creates a pop-up menu of individually selectable choices, similar to the File or Edit menu found in most software applications. The popped up menu can have as many levels of submenus as needed.

Inheritance Hierarchy

- *FlexObject*
  - FlexMenu

Syntax

```
'Declaration
Public Class FlexMenu _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors used for menu or submenu menu items in an alternating pattern.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the menu item background when a user rolls the mouse over it. The default value is 0xB2E1FF.
rowCount	the number of rows to be displayed.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index in the data provider of the selected item.
selectionColor	the color of the menu item background when a menu item is selected. The default value is 0x7FCEFF.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
textRollOverColor	the color of the menu item text when a user rolls the mouse over the menu item. The default value is 0x2B333C.
textSelectedColor	the color of the menu item text when the menu item is selected. The default value is 0x2B333C.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
Hide	Dispatched when a menu or submenu is dismissed.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when a menu item is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Show	Dispatched when a menu or submenu opens.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexMenuBar Class

Description
Defines a horizontal, top-level menu bar that contains one or more menus. Clicking on a top-level menu item opens a pop-up submenu that is an instance of the Menu control.

Inheritance Hierarchy

- *FlexObject*
  - FlexMenuBar

Syntax
```
'Declaration
Public Class FlexMenuBar _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundColor	the background color of the component.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background of the control.
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)

Name	Description
numChildren	the number of children of this object.
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the menu item background when a user rolls the mouse over it.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index in the MenuBar control of the currently open Menu or the last opened Menu if none are currently open.
selectionColor	the color of the menu item background when a menu item is selected.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container.
textDecoration	whether the text is underlined.
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
Hide	Dispatched when a menu or submenu is dismissed.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Show	Dispatched when a menu or submenu opens.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexNavigationBar Class

Description
The superclass for navigator controls, such as the LinkBar and TabBar controls. This class cannot be instantiated directly.

Inheritance Hierarchy

- *FlexBox*
  - FlexNavigationBar
    - *FlexButtonBar*
    - *FlexLinkBar*

Syntax

```
'Declaration
Public Class FlexNavigationBar _
Inherits FlexBox
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout. (Inherited from *FlexBox*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container. (Inherited from *FlexBox*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the active navigation item, where the first item is at an index of 0. The default value is -1.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container. (Inherited from *FlexBox*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)

Name	Description
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Defines the value of the type property of the event object for an itemClick event.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexNumericStepper Class

Description

Lets the user select a number from an ordered set.

The NumericStepper control consists of a single-line input text field and a pair of arrow buttons for stepping through the possible values. The Up Arrow and Down Arrow keys also cycle through the values.

Inheritance Hierarchy

- *FlexObject*
  - FlexNumericStepper

Syntax

```
'Declaration
Public Class FlexNumericStepper _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background of the control. Pass the same color for both values for a flat-looking control. The default value is [0xFFFFFF, 0xCCCCCC].
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface. Recognized values are normal and bold.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maximum	the maximum value of the NumericStepper.
minimum	the minimum value of the NumericStepper.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
nextValue	the value that is one step larger than the current value property and not greater than the maximum property value.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
previousValue	the value that is one step smaller than the current value property and not smaller than the maximum property value.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
stepSize	the non-zero unit of change between values.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. Possible values are: left, right, or center.
textDecoration	whether the text is underlined. Possible values are *none* and *underline*. The default value is *none*.
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	the value displayed in the text area of the NumericStepper control.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper control changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Lets you track selection within a text field.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexObject Class

Description
The base class for all visual components, both interactive and noninteractive.

Inheritance Hierarchy

- *FlexDisplayObject*
  - FlexObject
    - *FlexAxisRenderer*
    - *FlexButton*
    - *FlexChart*
    - *FlexChartLegend*

Syntax

```
'Declaration
Public Class FlexObject _
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	the name of this instance's class, such as *Button*.
currentState	the current view state of the component.
enabled	whether the component can accept user interaction.

Name	Description
errorColor	the color of the component highlight when validation fails.
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails.
focusEnabled	whether the component can receive focus when tabbed to.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size.
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN.
scaleX	the number that specifies the horizontal scaling factor.
scaleY	the number that specifies the vertical scaling factor.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component.
toolTip	the text to display in the ToolTip. The default value is `Nothing`.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexOLAPDataGrid Class

Description

Expands on the functionality of the AdvancedDataGrid control to add support for the display of the results of OLAP queries.

Like all Flex data grid controls, the OLAPDataGrid control is designed to display data in a two-dimensional representation of rows and columns.

Inheritance Hierarchy

- *FlexAdvancedDataGrid*
  - FlexOLAPDataGrid

Syntax

```
'Declaration
Public Class FlexOLAPDataGrid _
Inherits FlexAdvancedDataGrid
```

Properties

Name	Description
allowDragSelection	whether drag-selection is enabled. Drag-Selection is the ability to select an item by dragging into it as opposed to normal selection where you can't have the mouse button down when you mouse over the item you want to select. (Inherited from *FlexAdvancedDataGrid*)
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from *FlexListBase*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from *FlexListBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control. (Inherited from *FlexListBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexListBase*)

Name	Description
columnWidth	the width of the control's columns. (Inherited from *FlexListBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipField	the name of the field in the data provider items to display as the data tip. (Inherited from *FlexListBase*)
defaultCellString	the String displayed in a cell when the data for that cell returned by the IOLAPResult instance is `Nothing` or NaN.
depthColors	the array of colors used for the rows of each level of the navigation tree of the AdvancedDataGrid control, in descending order. The default value is undefined. (Inherited from *FlexAdvancedDataGrid*)
disabledColor	the color of text in the component if it is disabled. (Inherited from *FlexAdvancedDataGrid*)
displayItemsExpanded	whether the navigation tree is expanded to show all items. (Inherited from *FlexAdvancedDataGrid*)
editable	whether the user can edit items in the data provider. (Inherited from *FlexAdvancedDataGrid*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexListBase*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexListBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
headerColors	an array of two colors used to draw the header background gradient. (Inherited from *FlexAdvancedDataGrid*)
headerHeight	the height of the header cell of the column, in pixels. (Inherited from *FlexAdvancedDataGrid*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalGridLineColor	the color of the horizontal grid lines. (Inherited from *FlexAdvancedDataGrid*)
iconField	the name of the field in the data provider object that determines what to display as the icon. (Inherited from *FlexListBase*)
id	the ID of the component. (Inherited from *FlexObject*)
indentation	the indentation for each node of the navigation tree, in pixels. The default value is 17. (Inherited from *FlexAdvancedDataGrid*)

Name	Description
labelField	the name of the field in the data provider items to display as the label. (Inherited from *FlexListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexListBase*)
lockedColumnCount	the index of the first column in the control that scrolls. (Inherited from *FlexListBase*)
lockedRowCount	the index of the first row in the control that scrolls. (Inherited from *FlexListBase*)
minColumnWidth	the minimum width of the columns, in pixels. (Inherited from *FlexAdvancedDataGrid*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexListBase*)
numRows	the total number of rows of data available. (Inherited from *FlexListBase*)
openDuration	the length of an open or close transition for the navigation tree, in milliseconds. The default value is 250. (Inherited from *FlexAdvancedDataGrid*)
paddingBottom	the number of pixels between the bottom of the row and the bottom of the renderer in the row. (Inherited from *FlexAdvancedDataGrid*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexAdvancedDataGrid*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexAdvancedDataGrid*)
paddingTop	the number of pixels between the top of the row and the top of the renderer in the row. (Inherited from *FlexAdvancedDataGrid*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizableColumns	whether the user can change the size of the columns. (Inherited from *FlexAdvancedDataGrid*)

Name	Description
rollOverColor	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from *FlexListBase*)
rowCount	the number of rows to be displayed. (Inherited from *FlexListBase*)
rowHeight	the height of the rows in pixels. (Inherited from *FlexListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	whether the list shows selected items as selected. (Inherited from *FlexListBase*)
selectedCells	an Array of cell locations as row and column indices. (Inherited from *FlexAdvancedDataGrid*)
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexListBase*)
selectedIndices	an array of indices in the data provider of the selected items. (Inherited from *FlexListBase*)
selectedItem	a reference to the selected item in the data provider. (Inherited from *FlexListBase*)
selectedItems	an array of references to the selected items in the data provider. (Inherited from *FlexListBase*)
selectionColor	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from *FlexListBase*)
selectionDisabledColor	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from *FlexListBase*)
selectionMode	the selection mode of the control. (Inherited from *FlexAdvancedDataGrid*)
showDataTips	whether dataTips are displayed for text in the rows. (Inherited from *FlexListBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexListBase*)
textSelectedColor	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from *FlexListBase*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useRollOver	whether items are highlighted as the mouse rolls over them. (Inherited from *FlexListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
variableRowHeight	whether the individual rows can have different height. (Inherited from *FlexListBase*)
verticalAlign	the vertical alignment of a renderer in a row. (Inherited from *FlexListBase*)
verticalGridLineColor	the color of the vertical grid lines. The default value is 0x666666. (Inherited from *FlexAdvancedDataGrid*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped. (Inherited from *FlexListBase*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
Close	Closes or collapses a AdvancedDataGrid branch. (Inherited from *FlexAdvancedDataGrid*)
ColumnGroupedADGHeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index. (Inherited from *FlexAdvancedDataGrid*)
ColumnStretch	Dispatched when a user changes the width of a column, indicating that the amount of data displayed in that column may have changed. (Inherited from *FlexAdvancedDataGrid*)
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from *FlexListBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from *FlexListBase*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexListBase*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexListBase*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexListBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCellData	Returns data for a cell in the grid. (Inherited from *FlexAdvancedDataGrid*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetGroupedItemChildrenCount	Returns the number of children within the first item of a group. (Inherited from *FlexAdvancedDataGrid*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetRowData	Returns data for the row of the item in the data provider. (Inherited from *FlexAdvancedDataGrid*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexListBase*)
HeaderClick	Dispatched when the user releases the mouse button on a column header to request the control to sort the grid contents based on the contents of the column. (Inherited from *FlexAdvancedDataGrid*)
HeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index. (Inherited from *FlexAdvancedDataGrid*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsGroupedItem	Returns a value that specifies whether the item is a member of a group. (Inherited from *FlexAdvancedDataGrid*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from *FlexListBase*)
Open	Opens or expands an AdvancedDataGrid branch. (Inherited from *FlexAdvancedDataGrid*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexListBase*)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from *FlexListBase*)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPanel Class

Description

Consists of a title bar, a caption, a border, and a content area for its children.

Typically, you use Panel containers to wrap top-level application modules. For example, you can include a shopping cart in a Panel container.

Inheritance Hierarchy

- *FlexContainer*
  - FlexPanel
    - *FlexAlert*
    - *FlexTitleWindow*

Syntax

```
'Declaration
Public Class FlexPanel _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dropShadowEnabled	whether the Panel container's drop shadow is visible. The default value is true.

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
footerColors	the array of two colors used to draw the footer (area for the ControlBar container) background.
headerColors	the array of two colors used to draw the header.
headerHeight	the height of the header. The default value is based on the style of the title text.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)

Name	Description
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
status	the text in the status area of the title bar. The default value is "".
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	the title or caption displayed in the title bar. The default value is "".
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPieChart Class

Description

Represents a data series as a standard pie chart.

The data for the data provider determines the size of each wedge in the pie chart relative to the other wedges. You can use the PieSeries class to create standard pie charts, doughnut charts, or stacked pie charts.

Inheritance Hierarchy

- *FlexChart*
  - FlexPieChart

Syntax

```
'Declaration
Public Class FlexPieChart _
Inherits FlexChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)

Name	Description
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
innerRadius	the size of the hole in the center of the pie chart.
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)

Name	Description
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPieSeries Class

Description
Defines the data series for a PieChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexPieSeries

Syntax

```
'Declaration
Public Class FlexPieSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
calloutGap	how much space, in pixels, to insert between the edge of the pie and the labels when rendering callouts. The default value is 10.

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
explodeRadius	a number from 0 to 1, specifying how far all wedges of the pie series should be exploded from the center of the chart as a percentage of the total radius.
field	the field of the data provider that determines the data for each wedge of the PieChart control. The default value is `Nothing`.
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontSize	the height of the text, in pixels.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
innerRadius	a number from 0 to 1 specifying the distance from the center of the series to the inner edge of the rendered wedges, as a percentage of the total radius assigned to the series.
insideLabelSizeLimit	the font size threshold, in points, below which inside labels are considered illegible.
labelPosition	how to render value labels.
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
maxLabelRadius	the maximum amount of the PieSeries's radius that can be allocated to labels.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
nameField	the field of the data provider that determines the name of each wedge of the PieChart control. The default value is Nothing.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
outerRadius	the percentage of the total space available to the PieSeries to use when rendering the contents of the series.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
startAngle	the starting angle for the first slice of the PieChart control.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPlotChart Class

Description

Represents data with two values for each data point. One value determines the position of the data point along the horizontal axis, and one value determines its position along the vertical axis.

Inheritance Hierarchy

- *FlexCartesianChart*
  - FlexPlotChart

Syntax

```
'Declaration
Public Class FlexPlotChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from *FlexChart*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChart*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from *FlexChart*)
description	a short description of the data in the chart. (Inherited from *FlexChart*)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from *FlexChart*)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from *FlexChart*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChart*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexChart*)
fontSize	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from *FlexChart*)
gutterBottom	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from *FlexCartesianChart*)
gutterLeft	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from *FlexCartesianChart*)
gutterRight	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from *FlexCartesianChart*)
gutterTop	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from *FlexCartesianChart*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAxisRatio	the height limit of the horiztonal axis. (Inherited from *FlexCartesianChart*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChart*)
maximumDataTipCount	the maximum number of datatips a chart will show. (Inherited from *FlexChart*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseSensitivity	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from *FlexChart*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChart*)
numRows	the total number of rows of data available. (Inherited from *FlexChart*)
paddingBottom	the number of pixels between the chart's bottom border and its content area. (Inherited from *FlexChart*)
paddingLeft	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from *FlexChart*)
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from *FlexChart*)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from *FlexChart*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from *FlexChart*)

Name	Description
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from *FlexChart*)
selectionMode	whether ChartItem objects can be selected. (Inherited from *FlexChart*)
showDataTips	whether DataTip controls for the chart show. (Inherited from *FlexChart*)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from *FlexChart*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexCartesianChart*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAxisRatio	the width limit of the vertical axis. (Inherited from *FlexCartesianChart*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexChart*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexChart*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexChart*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChart*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from *FlexChart*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPlotSeries Class

Description
Defines a data series for a PlotChart control.

Inheritance Hierarchy

- *FlexChartSeries*
  - FlexPlotSeries

Syntax

```
'Declaration
Public Class FlexPlotSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexChartSeries*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexChartSeries*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexChartSeries*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexChartSeries*)
numRows	the total number of rows of data available. (Inherited from *FlexChartSeries*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
radius	the radius style
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from *FlexChartSeries*)
selectedItem	the chart item that is selected in the series. (Inherited from *FlexChartSeries*)
selectedItems	an array of chart items that are selected in the series. (Inherited from *FlexChartSeries*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
xField	the field of the data provider that determines the x-axis location of each data point.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
yField	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexChartSeries*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from *FlexChartSeries*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by

Name	Description
	the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexPopUpButton Class

Description

The PopUpButton control adds a flexible pop-up control interface to a Button control. It contains a main button and a secondary button, called the pop-up button, which pops up any UIComponent object when a user clicks the pop-up button.

A PopUpButton control can have a text label, an icon, or both on its face. When a user clicks the main part of the PopUpButton control, it dispatches a click event.

One common use for the PopUpButton control is to have the pop-up button open a List control or a Menu control that changes the function and label of the main button.

Inheritance Hierarchy

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from *FlexButton*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexButton*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexButton*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexButton*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexButton*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexButton*)
fontSize	the height of the text, in pixels. (Inherited from *FlexButton*)
fontStyle	whether the text is italic font. (Inherited from *FlexButton*)
fontWeight	whether the text is boldface. (Inherited from *FlexButton*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the Button control. (Inherited from *FlexButton*)

Name	Description
labelPlacement	the orientation of the label in relation to a specified icon. (Inherited from *FlexButton*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether a toggle button is toggled on (true) or off (false). (Inherited from *FlexButton*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexButton*)
textDecoration	whether the text is underlined. (Inherited from *FlexButton*)
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexButton*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexButton*)
textSelectedColor	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from *FlexButton*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)

Name	Description
toggle	whether a Button is in a toggle state or not. (Inherited from *FlexButton*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Dispatched when the specified UIComponent closes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Dispatched when the specified UIComponent opens.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexButton*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexProgressBar Class

Description

The ProgressBar control provides a visual representation of the progress of a task over time. There are two types of ProgressBar controls: determinate and indeterminate.

A determinate ProgressBar control is a linear representation of the progress of a task over time. You use a determinate ProgressBar when the scope of the task is known. It displays when the user has to wait for an extended amount of time.

An indeterminate ProgressBar control represents time-based processes for which the scope is not yet known. As soon as you can determine the scope, you should use a determinate ProgressBar control.

Inheritance Hierarchy

- *FlexObject*
  - FlexProgressBar

Syntax

```
'Declaration
Public Class FlexProgressBar _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
barColor	the color of a ProgressBar.
borderColor	the black section of a three-dimensional border, or the color section of a two-dimensional border. The default value is 0xB7BABC.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
conversion	the number used to convert incoming current bytes loaded value and the total bytes loaded values.
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	the direction in which the fill of the ProgressBar expands toward completion. Valid values in MXML are "right" and "left".
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background fill of the component.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
indeterminate	whether the ProgressBar control has a determinate or indeterminate appearance.
label	the text that accompanies the progress bar.
labelPlacement	the placement of the label.

Name	Description
labelWidth	the width of the label in pixels.
maximum	the largest progress value for the ProgressBar. You can only use this property in manual mode.
minimum	the smallest progress value for the ProgressBar. This property is set by the developer only in manual mode.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentComplete	the percentage of process that is completed. The range is 0 to 100.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container.
textDecoration	whether the text is underlined.
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	the amount of progress that has been made between the minimum and maximum values.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexRadioButton Class

Description
The RadioButton control lets the user make a single choice within a set of mutually exclusive choices.

Inheritance Hierarchy

- *FlexButton*
  - FlexRadioButton

Syntax
```
'Declaration
Public Class FlexRadioButton _
Inherits FlexButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from *FlexButton*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexButton*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
fillAlphas	the alphas used for the background fill of controls. (Inherited from *FlexButton*)
fillColors	the colors used to tint the background of the control. (Inherited from *FlexButton*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexButton*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexButton*)
fontSize	the height of the text, in pixels. (Inherited from *FlexButton*)
fontStyle	whether the text is italic font. (Inherited from *FlexButton*)
fontWeight	whether the text is boldface. (Inherited from *FlexButton*)
groupName	the name of the group to which this RadioButton control belongs, or specifies the value of the id property of a RadioButtonGroup control if this RadioButton is part of a group defined by a RadioButtonGroup control.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the Button control. (Inherited from *FlexButton*)
labelPlacement	the orientation of the label in relation to a specified icon. (Inherited from *FlexButton*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
selected	whether a toggle button is toggled on (true) or off (false). (Inherited from *FlexButton*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textAlign	the alignment of text within a container. (Inherited from *FlexButton*)
textDecoration	whether the text is underlined. (Inherited from *FlexButton*)
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from *FlexButton*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexButton*)
textSelectedColor	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from *FlexButton*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toggle	whether a Button is in a toggle state or not. (Inherited from *FlexButton*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from *FlexButton*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexRepeater Class

Description
Identifies the repeater control, which creates multiple instances of its subcomponents.

Inheritance Hierarchy

- *TestObject*
  - FlexRepeater

Syntax

```
'Declaration
Public Class FlexRepeater _
```

```
Inherits TestObject _
Implements IClickable, IKeyable
```

Properties

Name	Description
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	a string containing the class name of the element as assigned by the control developer.
columnNames	a list containing the names of all columns in the data.
count	the number of times this Repeater should execute.
firstVisibleRow	the index of the first visible child.
id	a string containing the automation identifier (ID) for the element.
lastVisibleRow	the index of the last visible child.
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
recycleChildren	whether this Repeater should re-use previously created children, or create new ones.
startingIndex	the index into the dataProvider at which this Repeater starts creating children.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexRule Class

Description

Creates a single horizontal or vertical line. You typically use this control to create a dividing line within a container.

Inheritance Hierarchy

- *FlexObject*
  - FlexRule

Syntax

```
'Declaration
Public Class FlexRule _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of the line.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
strokeWidth	the thickness of the rule in pixels.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexScrollBar Class

Description
Lets you control the portion of data that is displayed when there is too much data to fit in a display area.

Inheritance Hierarchy

- *FlexObject*
  - FlexScrollBar

Syntax
```
'Declaration
Public Class FlexScrollBar _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background of the control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)

Name	Description
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lineScrollSize	the amount to scroll when an arrow button is pressed, in pixels. The default value is 1.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
pageScrollSize	the amount to move the scroll thumb when the scroll bar track is pressed, in pixels. The default value is 0.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
scrollPosition	the number that represents the current scroll position.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
trackColors	The colors of the track, as an array of two colors.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the ScrollBar control scrolls through user initiated action or programmatically.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexScrollBase Class

Description

The ScrollControlBase class is the base class for controls with scroll bars.

The user interacts with the scroll bar or the developer accesses methods and properties that alter the viewable area. The ScrollControlBase takes a single child object and positions and masks or sizes that object to display the viewable content. All items to be scrolled must be children of that content object.

Inheritance Hierarchy

- *FlexObject*
  - FlexScrollBase
    - *FlexListBase*
    - *FlexTextArea*
    - *SparkAirHTML*

Syntax

```
'Declaration
Public Class FlexScrollBase _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)

Name	Description
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexSlider Class

Description

Lets users select a value by moving a slider thumb between the end points of the slider track.

The current value of the slider is determined by the relative location of the thumb between the end points of the slider, corresponding to the slider's minimum and maximum values.

Inheritance Hierarchy

- *FlexObject*
  - FlexSlider

Syntax

```
'Declaration
Public Class FlexSlider _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipPrecision	the number of decimal places to use for the data tip text.
direction	the orientation of the slider control.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillColors	the colors used to tint the background of the control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
labels	an array of strings used for the slider labels.
labelStyleName	the name of the style to use for the slider label. The default value is undefined.
liveDragging	whether live dragging is enabled for the slider.
maximum	the maximum allowed value on the slider. The default value is 10.
minimum	the minimum allowed value on the slider control. The default value is 0.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showDataTip	whether the data tip shows during user interaction.
snapInterval	the increment value of the slider thumb as the user moves the thumb.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)

Name	Description
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
thumbCount	the number of thumbs allowed on the slider.
tickColor	the color of the tick marks.
tickLength	the length in pixels of the tick marks.
tickThickness	the thickness in pixels of the tick marks.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
trackColors	the colors of the track, as an array of two colors.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	the position of the thumb, and is a number between the minimum and maximum properties.
values	an array of values for each thumb when thumbCount is greater than 1.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Change	Dispatched when the slider changes value due to mouse or keyboard interaction.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexStandalonePlayer Class

Description
The Flex Standalone Player.

Inheritance Hierarchy

- *Window*
  - `FlexStandalonePlayer`

Syntax

```
'Declaration
Public Class FlexStandalonePlayer _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from *Window*)

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexTabNavigator Class

Description
Extends the ViewStack container by including a TabBar container for navigating between its child containers.

Inheritance Hierarchy

- *FlexViewStack*
  - FlexTabNavigator

Syntax

```
'Declaration
Public Class FlexTabNavigator _
Inherits FlexViewStack
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal positioning of tabs at the top of this TabNavigator container.
horizontalGap	the separation between tabs, in pixels. The default value is -1, so that the borders of adjacent tabs overlap.
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
selectedChild	a reference to the currently visible child container. (Inherited from *FlexViewStack*)
selectedIndex	the zero-based index of the currently visible child container. (Inherited from *FlexViewStack*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabHeight	the height of each tab, in pixels.
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
tabWidth	the width of each tab, in pixels.
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Change	Defines the value of the type property of the event object for an itemClick event.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexViewStack*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexTextArea Class

Description

A multiline text field with a border and optional scroll bars.

The TextArea control supports the HTML rendering capabilities of Flash Player and AIR.

Inheritance Hierarchy

- *FlexScrollBase*
  - FlexTextArea

Syntax

```
'Declaration
Public Class FlexTextArea _
Inherits FlexScrollBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from *FlexObject*)
disabledColor	the background color of a component.
displayAsPassword	whether this control is used for entering passwords.
editable	whether the user can edit the text in this control.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPolicy	whether the horizontal scroll bar is always on (ScrollPolicy.ON), always off (ScrollPolicy.OFF), or turns on when needed (ScrollPolicy.AUTO).
htmlText	the text displayed by the TextInput control, including HTML markup that expresses the styles of that text.
id	the ID of the component. (Inherited from *FlexObject*)
length	the number of characters of text displayed in the TextArea.
maxChars	the maximum number of characters that users can enter in the text field.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can enter into the control.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectionBeginIndex	the zero-based character index value of the first character in the current selection.
selectionEndIndex	the zero-based index of the position after the last character in the current selection (equivalent to the one-based index of the last character).

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	the plain text that appears in the control.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control.

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event.
SelectText	Lets you track selection within a text field.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexTitleWindow Class

Description

Contains a title bar, a caption, a border, and a content area for its child.

Typically, you use TitleWindow containers to wrap self-contained application modules. For example, you can include a form in a TitleWindow container. When the user completes the form, you can close the TitleWindow container programmatically, or let the user close it by using the Close button.

Inheritance Hierarchy

- *FlexPanel*
  - FlexTitleWindow

Syntax

```
'Declaration
Public Class FlexTitleWindow _
Inherits FlexPanel
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dropShadowEnabled	whether the Panel container's drop shadow is visible. The default value is true. (Inherited from *FlexPanel*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)

Name	Description
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
footerColors	the array of two colors used to draw the footer (area for the ControlBar container) background. (Inherited from *FlexPanel*)
headerColors	the array of two colors used to draw the header. (Inherited from *FlexPanel*)
headerHeight	the height of the header. The default value is based on the style of the title text. (Inherited from *FlexPanel*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showCloseButton	whether to display a Close button in the TitleWindow container. The default value is false.\
status	the text in the status area of the title bar. The default value is "". (Inherited from *FlexPanel*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	the title or caption displayed in the title bar. The default value is "". (Inherited from *FlexPanel*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexToggleButtonBar Class

Description

Defines a horizontal or vertical group of buttons that maintain their selected or deselected state.

Only one button in the ToggleButtonBar control can be in the selected state. This means that when a user selects a button in a ToggleButtonBar control, the button stays in the selected state until the user selects a different button.

Inheritance Hierarchy

- *FlexButtonBar*
  - FlexToggleButtonBar

Syntax

```
'Declaration
Public Class FlexToggleButtonBar _
Inherits FlexButtonBar
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)

Name	Description
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
direction	whether to use vertical (default) or horizontal layout. (Inherited from *FlexBox*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of children in the container. (Inherited from *FlexBox*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from *FlexNavigationBar*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of children in the container. (Inherited from *FlexBox*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Defines the value of the type property of the event object for an itemClick event. (Inherited from *FlexNavigationBar*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexNavigationBar*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexTree Class

Description

The Tree control lets a user view hierarchical data arranged as an expandable tree.

Each item in a tree can be a leaf or a branch. A leaf item is an end point in the tree. A branch item can contain leaf or branch items, or it can be empty.

By default, a leaf is represented by a text label next to a file icon. A branch is represented by a text label next to a folder icon, with a disclosure triangle that a user can open to expose children.

Inheritance Hierarchy

- *FlexList*
  - FlexTree

Syntax

```
'Declaration
Public Class FlexTree _
Inherits FlexList
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from *FlexListBase*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from *FlexListBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)

Name	Description
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from *FlexListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control. (Inherited from *FlexListBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexListBase*)
columnWidth	the width of the control's columns. (Inherited from *FlexListBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dataTipField	the name of the field in the data provider items to display as the data tip. (Inherited from *FlexListBase*)
depthColors	the array of colors used in the Tree control, in descending order. The default value is undefined.
disabledColor	the disabled color of a list item. The default value is 0xDDDDDD.
editable	whether the user can edit items in the data provider.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexListBase*)
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from *FlexListBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
iconField	the name of the field in the data provider object that determines what to display as the icon. (Inherited from *FlexListBase*)
id	the ID of the component. (Inherited from *FlexObject*)
indentation	the indentation for each tree level, in pixels. The default value is 17.
labelField	the name of the field in the data provider items to display as the label. (Inherited from *FlexListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexListBase*)

Name	Description
lockedColumnCount	the index of the first column in the control that scrolls. (Inherited from *FlexListBase*)
lockedRowCount	the index of the first row in the control that scrolls. (Inherited from *FlexListBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *FlexListBase*)
numRows	the total number of rows of data available. (Inherited from *FlexListBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rollOverColor	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from *FlexListBase*)
rowCount	the number of rows to be displayed. (Inherited from *FlexListBase*)
rowHeight	the height of the rows in pixels. (Inherited from *FlexListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	whether the list shows selected items as selected. (Inherited from *FlexListBase*)
selectedIndex	the index in the data provider of the selected item. (Inherited from *FlexListBase*)
selectedIndices	an array of indices in the data provider of the selected items. (Inherited from *FlexListBase*)
selectedItem	a reference to the selected item in the data provider. (Inherited from *FlexListBase*)
selectedItems	an array of references to the selected items in the data provider. (Inherited from *FlexListBase*)

Name	Description
selectionColor	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from *FlexListBase*)
selectionDisabledColor	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from *FlexListBase*)
showDataTips	whether dataTips are displayed for text in the rows. (Inherited from *FlexListBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from *FlexListBase*)
textSelectedColor	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from *FlexListBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useRollOver	whether items are highlighted as the mouse rolls over them. (Inherited from *FlexListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
variableRowHeight	whether the individual rows can have different height. (Inherited from *FlexListBase*)
verticalAlign	the vertical alignment of a renderer in a row. (Inherited from *FlexListBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
wordWrap	whether text in the row should be word wrapped. (Inherited from *FlexListBase*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes or collapses a tree branch.
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from *FlexListBase*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from *FlexListBase*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexListBase*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexListBase*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexListBase*)
Edit	Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited. (Inherited from *FlexList*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *FlexListBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexScrollBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from *FlexListBase*)
Open	Opens or expands a tree branch.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from *FlexListBase*)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from *FlexListBase*)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from *FlexListBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *FlexListBase*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexUIMovieClip Class

Description

Components created in Adobe Flash CS3 Professional for use in Flex are subclasses of the mx.flash.UIMovieClip class.

The UIMovieClip class implements the interfaces necessary for a Flash component to be used like a normal Flex component. Therefore, a subclass of UIMovieClip can be used as a child of a Flex container or as a skin, and it can respond to events, define view states and transitions, and work with effects in the same way as can any Flex component.

Inheritance Hierarchy

- *FlexDisplayObject*
  - FlexUIMovieClip

- *FlexContainerMovieClip*

Syntax

```
'Declaration
Public Class FlexUIMovieClip _
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	the name of this instance's class, such as "Button".
currentState	the current state of this component.
enabled	whether a movie clip is enabled.
errorColor	the color of the component highlight when validation fails.
errorString	the text that is displayed by a component's error tip when a component is monitored and validation fails.
focusEnabled	whether the component can receive focus when selected.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. Valid values are 0 to 100.
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Valid values are 0 to 100.
scaleX	the horizontal scale (percentage) of the object as applied from the registration point. The default registration point is (0,0). 1.0 equals 100% scale.
scaleY	the vertical scale (percentage) of an object as applied from the registration point of the object. The default registration point is (0,0). 1.0 is 100% scale.

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component.
toolTip	the text to display in the ToolTip. The default value is `Nothing`.
useHandCursor	whether the pointing hand (hand cursor) appears when the mouse rolls over a sprite in which the buttonMode property is set to true.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Defines the value of the type property of a keyFocusChange event object.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Called by the FocusManager when the component receives focus. The component may in turn set focus to an internal component.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexVideoDisplay Class

Description

Lets you play an FLV file in a Flex application. It supports progressive download over HTTP, streaming from the Flash Media Server, and streaming from a Camera object.

Inheritance Hierarchy

- *FlexObject*
  - FlexVideoDisplay

Syntax

```
'Declaration
Public Class FlexVideoDisplay _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
source	the relative path and filename of the FLV file to stream.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
totalTime	the total length of the media, in seconds.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
volume	the volume level, specified as an value between 0 and 1. The default value is 0.75.
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexViewStack Class

Description
Consists of a collection of child containers stacked on top of each other, where only one child at a time is visible. When a different child container is selected, it seems to replace the old one because it appears in the same location. However, the old child container still exists; it is just invisible.

Inheritance Hierarchy

- *FlexContainer*
  - FlexViewStack
    - *FlexTabNavigator*

Syntax

```
'Declaration
Public Class FlexViewStack _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)

Name	Description
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)

Name	Description
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedChild	a reference to the currently visible child container.
selectedIndex	the zero-based index of the currently visible child container.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexWindow Class

Description
The Window is a top-level container for additional windows in an AIR desktop application.

Inheritance Hierarchy

- *FlexContainer*
  - FlexWindow

Syntax

```
'Declaration
Public Class FlexWindow _
Inherits FlexContainer _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)

Name	Description
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
closed	a value whether the underlying window has been closed.
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
isAIRWindow	a value whether this window is an AIR window.
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showStatusBar	a value whether the status bar is visible.

Name	Description
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
transparent	a value whether the window is transparent.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *IMoveable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
StateChange	Dispatched when the displaystatus of the window is changed.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FlexWindowedApplication Class

Description
The WindowedApplication defines the application container that you use to create Flex applications for AIR applications.

Inheritance Hierarchy

- *FlexApplication*
  - FlexWindowedApplication

Syntax

```
'Declaration
Public Class FlexWindowedApplication _
Inherits FlexApplication _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
applicationID	The identifier that AIR uses to identify the application.
autoExit	a value whether the AIR application will quit when the last window closes or will continue running in the background.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)

Name	Description
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from *FlexContainer*)
backgroundColor	the background color of a component. (Inherited from *FlexContainer*)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from *FlexContainer*)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from *FlexContainer*)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from *FlexContainer*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
closed	a value whether the underlying window has been closed.
columnNames	a list containing the names of all columns in the data. (Inherited from *FlexContainer*)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from *FlexContainer*)
creationPolicy	the child creation policy for this Container. (Inherited from *FlexContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from *FlexContainer*)
fillColors	the colors used to tint the background fill of the component. (Inherited from *FlexContainer*)
firstVisibleRow	the index of the first visible child. (Inherited from *FlexContainer*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
fontFamily	the name of the font to use. (Inherited from *FlexContainer*)
fontSize	the height of the text, in pixels. (Inherited from *FlexContainer*)
fontStyle	whether the text is italic font. (Inherited from *FlexContainer*)
fontWeight	whether the text is boldface. (Inherited from *FlexContainer*)

Name	Description
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text displayed by some navigator containers to represent this Container. (Inherited from *FlexContainer*)
lastVisibleRow	the index of the last visible child. (Inherited from *FlexContainer*)
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numChildren	the number of child components in this container. (Inherited from *FlexContainer*)
numColumns	the total number of columns of data available. (Inherited from *FlexContainer*)
numRows	the total number of rows of data available. (Inherited from *FlexContainer*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
showStatusBar	a value whether the status bar is visible.
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
transparent	a value whether the window is transparent.
url	the URL from which this Application's SWF file was loaded. (Inherited from *FlexApplication*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from *FlexContainer*)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from *FlexContainer*)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from *FlexContainer*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from *FlexContainer*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from *FlexContainer*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *IMoveable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from *FlexContainer*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkAirHTML Class

Description
The HTML control lets you display HTML content in your application.

Inheritance Hierarchy
- *FlexScrollBase*
  - SparkAirHTML

Syntax
```
'Declaration
Public Class SparkAirHTML _
Inherits FlexScrollBase
```

Properties
Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkApplication Class

Description
Flex defines a default, or Application, container that lets you start adding content to your application without explicitly defining another container.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkApplication
    - *SparkWindowedApplication*

Syntax

```
'Declaration
Public Class SparkApplication _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
colorCorrection	The value of the stage's colorCorrection property.

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
controlBarVisible	whether the control bar is visible.
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
url	The URL from which this Application's SWF file was loaded.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
viewSourceURL	the URL where the application's source can be viewed.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkBorderContainer Class

Description

The BorderContainer class defines a set of CSS styles that control the appearance of the border and background fill of the container.

Inheritance Hierarchy

- *SparkSkinnableContainer*

- SparkBorderContainer

Syntax

```
'Declaration
Public Class SparkBorderContainer _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkButton Class

Description

The SparkButton component is a commonly used rectangular button. The SparkButton component looks like it can be pressed.

Inheritance Hierarchy

- *SparkButtonBase*
  - SparkButton
    - *SparkMuteButton*

Syntax

```
'Declaration
Public Class SparkButton _
Inherits SparkButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
emphasized	whether the default button as requested by the focus manager.

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkButtonBar Class

Description
The ButtonBar control defines a horizontal group of logically related buttons with a common look and navigation.

Inheritance Hierarchy

- *SparkListBase*
  - SparkButtonBar

Syntax

```
'Declaration
Public Class SparkButtonBar _
Inherits SparkListBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)

Name	Description
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkButtonBarButton Class

Description
The ButtonBarButton class defines the custom item renderer used by the ButtonBar control.

Inheritance Hierarchy

- *SparkToggleButton*
  - SparkButtonBarButton

Syntax
```
'Declaration
Public Class SparkButtonBarButton _
Inherits SparkToggleButton
```

Properties

Name	Description
allowDeselection	a value whether the user click on a currently selected button deselects it.
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether the button is in the down state, and false if it is in the up state. (Inherited from *SparkToggleButtonBase*)
showsCaret	a value whether the item renderer can show itself as focused.
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from *SparkToggleButton*)
DragDrop	The event triggered when the dragged item is dropped. (Inherited from *SparkToggleButton*)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from *SparkToggleButton*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkButtonBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkButtonBase Class

Description
The SparkButtonBase class is the base class for the all Spark button components.

Inheritance Hierarchy

- *SparkObject*
  - SparkButtonBase
    - *SparkButton*
    - *SparkToggleButtonBase*

Syntax
```
'Declaration
Public Class SparkButtonBase _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)

Name	Description
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkCheckBox Class

Description

The CheckBox component consists of an optional label and a small box that can contain a check mark or not.

Inheritance Hierarchy

- *SparkToggleButtonBase*
  - SparkCheckBox

Syntax

```
'Declaration
Public Class SparkCheckBox _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether the button is in the down state, and false if it is in the up state. (Inherited from *SparkToggleButtonBase*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.

Name	Description
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkButtonBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkComboBox Class

Description

The ComboBox control is a child class of the DropDownListBase control. Like the DropDownListBase control, when the user selects an item from the drop-down list in the ComboBox control, the data item appears in the prompt area of the control.

Inheritance Hierarchy

- *SparkDropDownListBase*
  - SparkComboBox

Syntax

```
'Declaration
Public Class SparkComboBox _
Inherits SparkDropDownListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from *SparkList*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from *SparkList*)
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from *SparkList*)
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from *SparkList*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isDropDownOpen	a value whether the drop down is open. (Inherited from *SparkDropDownListBase*)
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
maxChars	The maximum number of characters that the prompt area can contain, as entered by a user.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)
restrict	The set of characters that a user can enter into the prompt area.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)
selectedIndices	a list representing the indices of the currently selected item or items. (Inherited from *SparkList*)
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)
selectedItems	a list of Objects representing the currently selected data items. (Inherited from *SparkList*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)

Name	Description
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Dispatched when the user clicks the drop-down button to display the drop-down list. (Inherited from *SparkDropDownListBase*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from *SparkList*)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkComplexDisplay Class

Description
A complex rendered object.

Inheritance Hierarchy

- *SparkListLabel*

- SparkComplexDisplay

Syntax

```
'Declaration
Public Class SparkComplexDisplay _
Inherits SparkListLabel
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
automationValue	A value which can be used to uniquely identify this item. (Inherited from *SparkListLabel*)
blendMode	A value from the BlendMode class that specifies which blend mode to use. (Inherited from *SparkGroup*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dragging	a value whether the SparkListLabel is in dragging mode. (Inherited from *SparkListLabel*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the label of the SparkListLabel. (Inherited from *SparkListLabel*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)

Name	Description
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridRight	the right coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridTop	the top coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	a value whether the SparkListLabel is selected. (Inherited from *SparkListLabel*)
showsCaret	a value whether the caret is shown. (Inherited from *SparkListLabel*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDataGrid Class

Description
Identifies a Spark data grid control.

Inheritance Hierarchy

- *SparkSkinnableContainerBase*
  - SparkDataGrid

Syntax

```
'Declaration
Public Class SparkDataGrid _
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
columnsLength	the count of the columns.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)

Name	Description
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
rowHeight	the height of the row.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedCell	the selected cell.
selectedCells	the selected cells.
selectedIndex	the index of the selected row.
selectedIndices	the indices of the selected rows.

Name	Description
selectedItem	the item of the selected row.
selectedItems	the items of the selected rows.
selectionLength	the number of selected rows.
selectionMode	the selection mode (singlerow, multiplerows, singlecells or multiplecells).
showDataTips	whether data tips should be shown.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
ColumnStretch	Stretches the given column of the data grid.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
EditNext	Sets the following data grid cell in the edit mode.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HeaderClick	Clicks on the specified column header.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects the specified data grid cell.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDataGridLabel Class

Description
Identifies a spark data grid label control.

Inheritance Hierarchy

- *FlexObject*
  - SparkDataGridLabel

Syntax

```
'Declaration
Public Class SparkDataGridLabel _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
automationValue	A value which can be used to uniquely identify this item.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDataGroup Class

Description
The DataGroup class is the base container class for data items.

Inheritance Hierarchy
- *SparkGroupBase*
  - SparkDataGroup

Syntax
```
'Declaration
Public Class SparkDataGroup _
Inherits SparkGroupBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)

Name	Description
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
Select	Dispatched when one or more items in the list are deselected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDataRenderer Class

Description
The SparkDataRenderer class is the base class for data components in spark.

Inheritance Hierarchy
- *SparkGroup*
  - SparkDataRenderer
    - *SparkListLabel*

Syntax
```
'Declaration
Public Class SparkDataRenderer _
Inherits SparkGroup
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
blendMode	A value from the BlendMode class that specifies which blend mode to use. (Inherited from *SparkGroup*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridRight	the right coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridTop	the top coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDropDownList Class

Description
The SparkDropDownList control contains a drop-down list from which the user can select a single value.

Inheritance Hierarchy

- *SparkDropDownListBase*
  - SparkDropDownList

Syntax

```
'Declaration
Public Class SparkDropDownList _
Inherits SparkDropDownListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from *SparkList*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from *SparkList*)
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from *SparkList*)
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from *SparkList*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)

Name	Description
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isDropDownOpen	a value whether the drop down is open. (Inherited from *SparkDropDownListBase*)
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
prompt	The prompt for the DropDownList control.
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)
selectedIndices	a list representing the indices of the currently selected item or items. (Inherited from *SparkList*)
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)

Name	Description
selectedItems	a list of Objects representing the currently selected data items. (Inherited from *SparkList*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Dispatched when the user clicks the drop-down button to display the drop-down list. (Inherited from *SparkDropDownListBase*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from *SparkList*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkDropDownListBase Class

Description
The SparkDropDownListBase control contains a drop-down list from which the user can select a single value.

Inheritance Hierarchy

- *SparkList*
  - SparkDropDownListBase
    - *SparkComboBox*
    - *SparkDropDownList*

Syntax

```
'Declaration
Public Class SparkDropDownListBase _
Inherits SparkList
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from *SparkList*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from *SparkList*)
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from *SparkList*)
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from *SparkList*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isDropDownOpen	a value whether the drop down is open.
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)

Name	Description
selectedIndices	a list representing the indices of the currently selected item or items. (Inherited from *SparkList*)
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)
selectedItems	a list of Objects representing the currently selected data items. (Inherited from *SparkList*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
Open	Dispatched when the user clicks the drop-down button to display the drop-down list.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from *SparkList*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkForm Class

Description
Identifies a Spark form control.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkForm

Syntax

```
'Declaration
Public Class SparkForm _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkFormItem Class

Description
Identifies a Spark form item control.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkFormItem

Syntax
```
'Declaration
Public Class SparkFormItem _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text of the form items label.
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
required	whether the form item has to have a value to submit the form.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
sequenceLabel	the number of the form item in the form.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkGroup Class

Description
Use this container when you want to manage visual children, both visual components and graphical components.

Inheritance Hierarchy

- *SparkGroupBase*
  - SparkGroup
    - *SparkDataRenderer*
    - *SparkTileGroup*

Syntax
```
'Declaration
Public Class SparkGroup _
Inherits SparkGroupBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
blendMode	A value from the BlendMode class that specifies which blend mode to use.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleGridBottom	the bottom coordinate of the scale grid.
scaleGridLeft	the left coordinate of the scale grid.
scaleGridRight	the right coordinate of the scale grid.
scaleGridTop	the top coordinate of the scale grid.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkGroupBase Class

Description
The GroupBase class defines the base class for components that display visual elements.

Inheritance Hierarchy
- *FlexObject*
  - SparkGroupBase
    - *SparkDataGroup*
    - *SparkGroup*

Syntax
```
'Declaration
Public Class SparkGroupBase _
Inherits FlexObject
```

Properties
Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport.
columnNames	a list containing the names of all columns in the data.
contentHeight	The height of the viewport's content.

Name	Description
contentWidth	The width of the viewport's contents.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
luminosityClip	a value whether the luminosity mask clips the masked content.
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask.
maskType	The mask type.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numElements	The number of visual elements in this container.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled.
DragDrop	Dispatched when the dragged item is dropped.
DragStart	Dispatched when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkImage Class

Description
Identifies a Spark image control.

Inheritance Hierarchy

- *SparkObject*
  - SparkImage

Syntax

```
'Declaration
Public Class SparkImage _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
bytesLoaded	the number of bytes of the image already loaded.
bytesTotal	the total image data in bytes loaded or pending load.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clearOnLoad	whether or not to clear previous image content prior to loading new content.
contentLoaderGrouping	the optional content grouping identifier to pass to the an associated IContentLoader instance's load() method.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
fillMode	a value how the bitmap fills in the dimensions.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalAlign	the horizontal alignment of the content when it does not have a one-to-one aspect ratio and scaleMode is set to BitmapScaleMode.LETTERBOX.

Name	Description
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
preliminaryHeight	an estimate to use for height when the "measured" bounds of the image is requested by layout, but the image data has yet to complete loading.
preliminaryWidth	an estimate to use for width when the "measured" bounds of the image is requested by layout, but the image data has yet to complete loading.
scaleMode	whether the image is scaled when fillMode is set to BitmapFillMode.SCALE.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
smooth	whether to apply a smoothing algorithm to the bitmap image.
source	the content location.
sourceHeight	the unscaled height of the original image data.
sourceWidth	the unscaled width of the original image data.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
trustedSource	a flag denoting whether the currently loaded content is considered loaded from a source whose security policy allows for cross domain image access.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalAlign	the vertical alignment of the content when it does not have a one-to-one aspect ratio and scaleMode is set to BitmapScaleMode.LETTERBOX.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkLabel Class

Description

Label is a low-level UIComponent that can render one or more lines of uniformly-formatted text.

Inheritance Hierarchy

- *SparkTextBase*
  - SparkLabel

Syntax

```
'Declaration
Public Class SparkLabel _
Inherits SparkTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)

Name	Description
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isTruncated	whether the text has been truncated. (Inherited from *SparkTextBase*)
maxDisplayedLines	An integer which determines whether, and where, the text gets truncated. (Inherited from *SparkTextBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text displayed by this text component. (Inherited from *SparkTextBase*)

Name	Description
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from *SparkTextBase*)
DragDrop	The event triggered when the dragged item is dropped. (Inherited from *SparkTextBase*)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from *SparkTextBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkTextBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkList Class

Description
The List control displays a vertical list of items.

Inheritance Hierarchy

- *SparkListBase*
  - SparkList
    - *SparkDropDownListBase*

Syntax

```
'Declaration
Public Class SparkList _
Inherits SparkListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled.
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls.
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation.
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)
selectedIndices	a list representing the indices of the currently selected item or items.
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)
selectedItems	a list of Objects representing the currently selected data items.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkListBase Class

Description
The ListBase class is the base class for all components that support selection.

Inheritance Hierarchy

- *SparkSkinnableDataContainer*
  - SparkListBase
    - *SparkButtonBar*
    - *SparkList*
    - *SparkTabBar*

Syntax
```
'Declaration
Public Class SparkListBase _
Inherits SparkSkinnableDataContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	The name of the field in the data provider items to display as the label.
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected.
selectedItem	The item that is currently selected.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkListLabel Class

Description
A simple rendered object.

Inheritance Hierarchy

- *SparkDataRenderer*
  - SparkListLabel
    - *SparkComplexDisplay*

Syntax

```
'Declaration
Public Class SparkListLabel _
Inherits SparkDataRenderer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
automationValue	A value which can be used to uniquely identify this item.
blendMode	A value from the BlendMode class that specifies which blend mode to use. (Inherited from *SparkGroup*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
dragging	a value whether the SparkListLabel is in dragging mode.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the label of the SparkListLabel.
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)

Name	Description
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridRight	the right coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridTop	the top coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	a value whether the SparkListLabel is selected.
showsCaret	a value whether the caret is shown.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkMuteButton Class

Description
The MuteButton class defines the mute button used by the VideoPlayer control.

Inheritance Hierarchy

- *SparkButton*
  - SparkMuteButton

Syntax
```
'Declaration
Public Class SparkMuteButton _
Inherits SparkButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
currentState	the current view state of the component. (Inherited from *FlexObject*)
emphasized	whether the default button as requested by the focus manager. (Inherited from *SparkButton*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
muted	a value whether the control is muted.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
volume	the volume of the control.
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MuteChange	Toggles the muting of the control.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkButtonBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkNavigatorContent Class

Description
The NavigatorContent class defines a Spark container that can be used in an MX navigator container, such as the ViewStack, TabNavigator and Accordion containers.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkNavigatorContent

Syntax

```
'Declaration
Public Class SparkNavigatorContent _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkNumericStepper Class

Description
The NumericStepper control lets you select a number from an ordered set. The NumericStepper provides the same functionality as the Spinner component, but adds a TextInput control so that you can directly edit the value of the component, rather than modifying it by using the control's arrow buttons.

Inheritance Hierarchy

- *SparkSpinner*
  - SparkNumericStepper

Syntax

```
'Declaration
Public Class SparkNumericStepper _
Inherits SparkSpinner
```

Properties

Name	Description
allowValueWrap	the behavior of the control for a step when the current value is either the maximum or minimum value. (Inherited from *SparkSpinner*)
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
enableIME	a value whether the IME should be enabled when the component receives focus.
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)

Name	Description
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
imeMode	the IME (Input Method Editor) mode.
maxChars	The maximum number of characters that can be entered in the field.
maximum	The maximum valid value. (Inherited from *SparkRange*)
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from *SparkSpinner*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkSpinner*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkObject Class

Description
The SparkObject class defines the base class for all spark components.

Inheritance Hierarchy

- *FlexObject*
  - SparkObject
    - *SparkButtonBase*
    - *SparkImage*
    - *SparkRange*
    - *SparkRichEditableText*
    - *SparkSkinnableContainerBase*
    - *SparkSkinnableTextBase*
    - *SparkVideoPlayer*

Syntax

```
'Declaration
Public Class SparkObject _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkPanel Class

Description
The Panel class defines a container that includes a title bar, a caption, a border, and a content area for its children.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkPanel
    - *SparkTitleWindow*

Syntax

```
'Declaration
Public Class SparkPanel _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
controlBarVisible	a value whether the control bar is visible.
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	the title or caption displayed in the title bar.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkPopUpAnchor Class

Description
Identifies a Spark PopUpAnchor control.

Inheritance Hierarchy

- *FlexObject*
  - SparkPopUpAnchor

Syntax

```
'Declaration
Public Class SparkPopUpAnchor _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
displayPopUp	whether the popUp is visible.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
popUpHeightMatchesAnchorHeight	whether the height of the popUp control is set to the value of the PopUpAnchor's height.
popUpPosition	the position of the popUp control when it is opened, relative to the PopUpAnchor component.
popUpWidthMatchesAnchorWidth	whether the width of the popUp control is set to the value of the PopUpAnchor's width.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkRadioButton Class

Description
The RadioButton component allows the user make a single choice within a set of mutually exclusive choices. A RadioButtonGroup is composed of two or more RadioButton components with the same groupName property.

Inheritance Hierarchy

- *SparkToggleButtonBase*
  - SparkRadioButton

Syntax

```
'Declaration
Public Class SparkRadioButton _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
groupName	the name of the group to which this RadioButton component belongs, or specifies the value of the id property of a RadioButtonGroup component if this RadioButton is part of a group defined by a RadioButtonGroup component.
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether the button is in the down state, and false if it is in the up state. (Inherited from *SparkToggleButtonBase*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkButtonBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkRange Class

Description
The Range class holds a value and an allowed range for that value, defined by minimum and maximum properties.

Inheritance Hierarchy

- *SparkObject*
  - SparkRange
    - *SparkSpinner*
    - *SparkTrackBase*

Syntax

```
'Declaration
Public Class SparkRange _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
maximum	The maximum valid value.
minimum	The minimum valid value.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval.
stepSize	The amount that the value property changes when the changeValueByStep() method is called.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)

Name	Description
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkRichEditableText Class

Description
RichEditableText is a low-level UIComponent for displaying, scrolling, selecting, and editing richly-formatted text.

Inheritance Hierarchy

- *SparkObject*
  - SparkRichEditableText

Syntax

```
'Declaration
Public Class SparkRichEditableText _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	whether to clip the children to the boundaries of the viewport.
columnNames	a list containing the names of all columns in the data.
contentHeight	The height of the text.
contentWidth	The width of the text.
currentState	the current view state of the component. (Inherited from *FlexObject*)
displayAsPassword	whether the text field is a password text field.
editable	A flag indicating whether the user is allowed to edit the text in this control.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
enableIME	A flag that indicates whether the IME should be enabled when the component receives focus.
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
heightInLines	The default height of the control, measured in lines.
horizontalScrollPosition	The number of pixels by which the text is scrolled horizontally.
id	the ID of the component. (Inherited from *FlexObject*)
imeMode	the IME (input method editor) mode.
lastVisibleRow	the index of the last visible child.
maxChars	The maximum number of characters that the text field can contain, as entered by a user.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
multiline	whether the user can enter multiline text.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can enter into the text field.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.

Name	Description
selectionActivePosition	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
selectionAnchorPosition	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
selectionHighlighting	a value whether the text selection is highlighted.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text String displayed by this component.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The number of pixels by which the text is scrolled vertically.
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
widthInChars	The default width of the control, measured in em units.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkRichText Class

Description
RichText is a low-level UIComponent that can display one or more lines of richly-formatted text and embedded images.

Inheritance Hierarchy

- *SparkTextBase*
  - SparkRichText

Syntax

```
'Declaration
Public Class SparkRichText _
Inherits SparkTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isTruncated	whether the text has been truncated. (Inherited from *SparkTextBase*)
luminosityClip	whether the luminosity mask clips the masked content.
luminosityInvert	whether the calculation of the RGB color value of a graphic element is masked by a luminosity mask.
maskType	how the mask is applied to the component. The possible values are MaskType.CLIP, MaskType.ALPHA and MaskType.LUMINOSITY. Clip Masking When masking in clip mode, a clipping masks is reduced to 1-bit.

Name	Description
maxDisplayedLines	An integer which determines whether, and where, the text gets truncated. (Inherited from *SparkTextBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text displayed by this text component. (Inherited from *SparkTextBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from *SparkTextBase*)
DragDrop	The event triggered when the dragged item is dropped. (Inherited from *SparkTextBase*)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from *SparkTextBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkTextBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkScrollBar Class

Description
The ScrollBarBase class helps to position the portion of data that is displayed when there is too much data to fit in a display area.

Inheritance Hierarchy

- *SparkTrackBase*
  - SparkScrollBar

Syntax

```
'Declaration
Public Class SparkScrollBar _
Inherits SparkTrackBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maximum	The maximum valid value. (Inherited from *SparkRange*)
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
pageSize	The change in the value of the value property when you call the changeValueByPage() method.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from *SparkTrackBase*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkTrackBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSkinnableContainer Class

Description
The SparkSkinnableContainer class is the base class for skinnable containers that have visual content.

Inheritance Hierarchy

- *SparkSkinnableContainerBase*
  - SparkSkinnableContainer
    - *SparkApplication*
    - *SparkBorderContainer*
    - *SparkForm*
    - *SparkFormItem*
    - *SparkNavigatorContent*
    - *SparkPanel*
    - *SparkSkinnablePopUpContainer*
    - *SparkWindow*

Syntax

```
'Declaration
Public Class SparkSkinnableContainer _
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component.
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container.
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSkinnableContainerBase Class

Description
Base class for spark container components.

Inheritance Hierarchy

- *SparkObject*
  - SparkSkinnableContainerBase

- *SparkDataGrid*
- *SparkSkinnableContainer*
- *SparkSkinnableDataContainer*

Syntax

```
'Declaration
Public Class SparkSkinnableContainerBase _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled.
DragDrop	Dispatched when the dragged item is dropped.
DragStart	Dispatched when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSkinnableDataContainer Class

Description
The SkinnableDataContainer class is the base container class for data items.

Inheritance Hierarchy

- *SparkSkinnableContainerBase*

- SparkSkinnableDataContainer
  - *SparkListBase*

Syntax

```
'Declaration
Public Class SparkSkinnableDataContainer _
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	the measurement and layout are done when the position or size of a child is changed.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that

Name	Description
	is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSkinnablePopUpContainer Class

Description
Identifies a SparkSkinnablePopUpContainer control.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkSkinnablePopUpContainer

Syntax

```
'Declaration
Public Class SparkSkinnablePopUpContainer _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isOpen	whether the container is open.
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSkinnableTextBase Class

Description

The base class for skinnable components, such as the Spark TextInput and TextArea, that include an instance of RichEditableText in their skin to provide rich text display, scrolling, selection, and editing.

Inheritance Hierarchy

- *SparkObject*
  - SparkSkinnableTextBase
    - *SparkTextArea*
    - *SparkTextInput*

Syntax

```
'Declaration
Public Class SparkSkinnableTextBase _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from *FlexObject*)
displayAsPassword	whether the text field is a password text field.
editable	A flag indicating whether the user is allowed to edit the text in this control.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
enableIME	A flag that indicates whether the IME should be enabled when the component receives focus.
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
imeMode	the IME (input method editor) mode.
lastVisibleRow	the index of the last visible child.
maxChars	The maximum number of characters that the text field can contain, as entered by a user.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of

Name	Description
	this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can enter into the text field.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.
selectionActivePosition	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
selectionAnchorPosition	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
selectionHighlighting	a value whether the text selection is highlighted.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text String displayed by this component.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSlider Class

Description

Lets users select a value by moving a slider thumb between the end points of the slider track.

Inheritance Hierarchy

- *SparkTrackBase*
  - SparkSlider
    - *SparkVolumeBar*

Syntax

```
'Declaration
Public Class SparkSlider _
Inherits SparkTrackBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)

Name	Description
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maximum	The maximum valid value. (Inherited from *SparkRange*)
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)

Name	Description
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from *SparkTrackBase*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkTrackBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkSpinner Class

Description
A Spinner component selects a value from an ordered set. It uses two buttons that increase or decrease the current value based on the current value of the stepSize property.

Inheritance Hierarchy

- *SparkRange*
  - SparkSpinner
    - *SparkNumericStepper*

Syntax

```
'Declaration
Public Class SparkSpinner _
Inherits SparkRange
```

Properties

Name	Description
allowValueWrap	the behavior of the control for a step when the current value is either the maximum or minimum value.
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)

Name	Description
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maximum	The maximum valid value. (Inherited from *SparkRange*)
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)

Name	Description
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction.

Name	Description
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTabBar Class

Description

The TabBar class displays a set of identical tabs. One tab can be selected at a time, and the first tab is selected by default.

Inheritance Hierarchy

- *SparkListBase*
  - SparkTabBar

Syntax

```
'Declaration
Public Class SparkTabBar _
Inherits SparkListBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableDataContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
caretIndex	The item that is currently in focus. (Inherited from *SparkListBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
labelField	The name of the field in the data provider items to display as the label. (Inherited from *SparkListBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
requireSelection	a value if a data item must always be selected in the control (Inherited from *SparkListBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from *SparkListBase*)
selectedItem	The item that is currently selected. (Inherited from *SparkListBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from *SparkListBase*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)

Name	Description
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from *SparkListBase*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Dispatched when an item in the list is selected. (Inherited from *SparkListBase*)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkListBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTextArea Class

Description

TextArea is a text-entry control that lets users enter and edit multiple lines of richly formatted text. It can display horizontal and vertical scrollbars for scrolling through the text and supports vertical scrolling with the mouse wheel.

Inheritance Hierarchy

- *SparkSkinnableTextBase*
  - SparkTextArea

Syntax

```
'Declaration
Public Class SparkTextArea _
Inherits SparkSkinnableTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableTextBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
displayAsPassword	whether the text field is a password text field. (Inherited from *SparkSkinnableTextBase*)
editable	A flag indicating whether the user is allowed to edit the text in this control. (Inherited from *SparkSkinnableTextBase*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
enableIME	A flag that indicates whether the IME should be enabled when the component receives focus. (Inherited from *SparkSkinnableTextBase*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableTextBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
heightInLines	The default height of the control, measured in lines.
id	the ID of the component. (Inherited from *FlexObject*)
imeMode	the IME (input method editor) mode. (Inherited from *SparkSkinnableTextBase*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableTextBase*)
maxChars	The maximum number of characters that the text field can contain, as entered by a user. (Inherited from *SparkSkinnableTextBase*)
maxWidth	The maximum recommended width of the component to be considered by the parent during layout. (Inherited from *SparkSkinnableTextBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableTextBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableTextBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can enter into the text field. (Inherited from *SparkSkinnableTextBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from *SparkSkinnableTextBase*)
selectionActivePosition	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from *SparkSkinnableTextBase*)
selectionAnchorPosition	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from *SparkSkinnableTextBase*)
selectionHighlighting	a value whether the text selection is highlighted. (Inherited from *SparkSkinnableTextBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text String displayed by this component. (Inherited from *SparkSkinnableTextBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)

Name	Description
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
widthInChars	The default width of the control, measured in em units.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableTextBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Input	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from *SparkSkinnableTextBase*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkSkinnableTextBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Dispatched when text is selected. (Inherited from *SparkSkinnableTextBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkSkinnableTextBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTextBase Class

Description

The base class for Spark text controls such as Label and RichText which display text using CSS styles for the default format.

Inheritance Hierarchy

- *FlexObject*
  - SparkTextBase
    - *SparkLabel*
    - *SparkRichText*

Syntax

```
'Declaration
Public Class SparkTextBase _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)

Name	Description
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isTruncated	whether the text has been truncated.
maxDisplayedLines	An integer which determines whether, and where, the text gets truncated.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
text	The text displayed by this text component.
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableTextBase*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableTextBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
restrict	the set of characters that a user can enter into the text field. (Inherited from *SparkSkinnableTextBase*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selectable	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from *SparkSkinnableTextBase*)
selectionActivePosition	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from *SparkSkinnableTextBase*)
selectionAnchorPosition	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from *SparkSkinnableTextBase*)
selectionHighlighting	a value whether the text selection is highlighted. (Inherited from *SparkSkinnableTextBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
text	The text String displayed by this component. (Inherited from *SparkSkinnableTextBase*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
widthInChars	The default width of the control, measured in em units.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableTextBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Input	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from *SparkSkinnableTextBase*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkSkinnableTextBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectText	Dispatched when text is selected. (Inherited from *SparkSkinnableTextBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkSkinnableTextBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTileGroup Class

Description
The TileGroup container is an instance of the Group container that uses the TileLayout class.

Inheritance Hierarchy
- *SparkGroup*
  - SparkTileGroup

Syntax
```
'Declaration
Public Class SparkTileGroup _
Inherits SparkGroup
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkGroupBase*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
blendMode	A value from the BlendMode class that specifies which blend mode to use. (Inherited from *SparkGroup*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from *SparkGroupBase*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkGroupBase*)
contentHeight	The height of the viewport's content. (Inherited from *SparkGroupBase*)
contentWidth	The width of the viewport's contents. (Inherited from *SparkGroupBase*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkGroupBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
horizontalScrollPosition	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from *SparkGroupBase*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *SparkGroupBase*)
luminosityClip	a value whether the luminosity mask clips the masked content. (Inherited from *SparkGroupBase*)
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from *SparkGroupBase*)
maskType	The mask type. (Inherited from *SparkGroupBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from *SparkGroupBase*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkGroupBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkGroupBase*)
numRows	the total number of rows of data available. (Inherited from *SparkGroupBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizeMode	The ResizeMode for this container. (Inherited from *SparkGroupBase*)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridRight	the right coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleGridTop	the top coordinate of the scale grid. (Inherited from *SparkGroup*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from *SparkGroupBase*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkGroupBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkGroupBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkGroupBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkGroupBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from *SparkGroupBase*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from *SparkGroupBase*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkGroupBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTitleWindow Class

Description
The TitleWindow class extends Panel to include a close button and move area.

Inheritance Hierarchy

- *SparkPanel*
  - SparkTitleWindow

Syntax

```
'Declaration
Public Class SparkTitleWindow _
Inherits SparkPanel
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
controlBarVisible	a value whether the control bar is visible. (Inherited from *SparkPanel*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	the title or caption displayed in the title bar. (Inherited from *SparkPanel*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkPanel*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkToggleButton Class

Description
The ToggleButton component defines a toggle button. Clicking the button toggles it between the up and an down states.

Inheritance Hierarchy

- *SparkToggleButtonBase*
  - SparkToggleButton
    - *SparkButtonBarButton*

Syntax

```
'Declaration
Public Class SparkToggleButton _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)

Name	Description
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether the button is in the down state, and false if it is in the up state. (Inherited from *SparkToggleButtonBase*)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.

Name	Description
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkButtonBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkToggleButtonBase Class

Description

The ToggleButtonBase component is the base class for the Spark button components that support the selected property.

Inheritance Hierarchy

- *SparkButtonBase*
  - SparkToggleButtonBase
    - *SparkCheckBox*
    - *SparkRadioButton*
    - *SparkToggleButton*

Syntax

```
'Declaration
Public Class SparkToggleButtonBase _
Inherits SparkButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from *SparkButtonBase*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
label	the text to appear on the ButtonBase control. (Inherited from *SparkButtonBase*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
selected	whether the button is in the down state, and false if it is in the up state.
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from *SparkButtonBase*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkTrackBase Class

Description
The TrackBase class is a base class for components with a track and one or more thumb buttons, such as Slider and ScrollBar.

Inheritance Hierarchy

- *SparkRange*
  - SparkTrackBase
    - *SparkScrollBar*
    - *SparkSlider*

Syntax

```
'Declaration
Public Class SparkTrackBase _
Inherits SparkRange
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
maximum	The maximum valid value. (Inherited from *SparkRange*)
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkVideoDisplay Class

Description
Identifies a Spark video display control.

Inheritance Hierarchy

- *FlexObject*

- SparkVideoDisplay

Syntax

```
'Declaration
Public Class SparkVideoDisplay _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
autoDisplayFirstFrame	whether the video is loaded when the source is set.
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
autoPlay	whether the video starts playing immediately when the source property is set.
autoRewind	whether the FLV file should rewind to the first frame when play stops.
bytesLoaded	the number of bytes of data that have been downloaded into the application.
bytesTotal	the total size in bytes of the data being downloaded into the application.
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
currentTime	the current time of the playhead, measured in seconds, since the video starting playing.
duration	the duration of the video's playback, in seconds.
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)

Name	Description
loop	whether the media should play again after playback has completed.
mediaPlayerState	the current state of the video.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
muted	whether the video is muted.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
pauseWhenHidden	whether the video continues to play when it is "hidden".
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
playing	a value whether the video is playing or is attempting to play.
scaleMode	the different ways of sizing the video content.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
volume	the volume level, specified as a value between 0 and 1.
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkVideoPlayer Class

Description
The VideoPlayer control is a skinnable video player that supports progressive download, multi-bitrate streaming, and streaming video.

Inheritance Hierarchy

- *SparkObject*
  - SparkVideoPlayer

Syntax

```
'Declaration
Public Class SparkVideoPlayer _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
id	the ID of the component. (Inherited from *FlexObject*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
muted	a value whether the control is muted.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
playing	a value if the video is playing or is attempting to play.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
volume	The volume level, specified as a value between 0 and 1.
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)

Name	Description
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkVolumeBar Class

Description
The VolumeBar class defines a drop-down slider to control the volume of the VideoDisplay control.

Inheritance Hierarchy

- *SparkSlider*
  - SparkVolumeBar

Syntax
```
'Declaration
Public Class SparkVolumeBar _
Inherits SparkSlider
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isDropDownOpen	a value whether the volumebar is open.
maximum	The maximum valid value. (Inherited from *SparkRange*)

Name	Description
minimum	The minimum valid value. (Inherited from *SparkRange*)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
muted	a value whether the control is muted.
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
snapInterval	the snapInterval. (Inherited from *SparkRange*)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from *SparkRange*)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
value	The current value for this range. (Inherited from *SparkRange*)

Name	Description
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from *SparkTrackBase*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *FlexObject*)
MuteChange	Dispatched when the mute status changes as a result of user interaction.
Open	Dispatched when the user clicks the drop-down button to display the drop-down list.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkTrackBase*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkWindow Class

Description

The Window is a top-level container for additional windows in an AIR desktop application.

Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkWindow

Syntax

```
'Declaration
Public Class SparkWindow _
Inherits SparkSkinnableContainer _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
closed	a value whether the underlying window has been closed.

Name	Description
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
isAIRWindow	a value whether this window is an AIR window.
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showStatusBar	a value whether the status bar is visible.
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
transparent	a value whether the window is transparent.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)

Name	Description
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *IMoveable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
StateChange	Dispatched when the displaystatus of the window is changed.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SparkWindowedApplication Class

Description
The WindowedApplication defines the application container that you use to create Flex applications for AIR applications.

Inheritance Hierarchy

- *SparkApplication*
  - SparkWindowedApplication

Syntax

```
'Declaration
Public Class SparkWindowedApplication _
Inherits SparkApplication _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from *FlexDisplayObject*)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
applicationID	The identifier that AIR uses to identify the application.
autoExit	a value whether the AIR application will quit when the last window closes or will continue running in the background.
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from *SparkSkinnableContainer*)
automationClassName	a string containing the automation class name for the element. (Inherited from *FlexObject*)
automationIndex	a string containing the automation index for the element. (Inherited from *FlexObject*)
automationName	the name that can be used as an identifier for this object. (Inherited from *FlexObject*)
className	the name of this instance's class, such as *Button*. (Inherited from *FlexObject*)
closed	a value whether the underlying window has been closed.
colorCorrection	The value of the stage's colorCorrection property. (Inherited from *SparkApplication*)
columnNames	a list containing the names of all columns in the data. (Inherited from *SparkSkinnableContainerBase*)
controlBarVisible	whether the control bar is visible. (Inherited from *SparkApplication*)
creationPolicy	the content creation policy for this component. (Inherited from *SparkSkinnableContainer*)
currentState	the current view state of the component. (Inherited from *FlexObject*)
deferredContentCreated	whether deferred content has been created. (Inherited from *SparkSkinnableContainer*)
enabled	whether the component can accept user interaction. (Inherited from *FlexObject*)
errorColor	the color of the component highlight when validation fails. (Inherited from *FlexObject*)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from *FlexObject*)
firstVisibleRow	the index of the first visible child. (Inherited from *SparkSkinnableContainerBase*)

Name	Description
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from *FlexObject*)
height	the height of the display object, in pixels. (Inherited from *FlexDisplayObject*)
id	the ID of the component. (Inherited from *FlexObject*)
lastVisibleRow	the index of the last visible child. (Inherited from *SparkSkinnableContainerBase*)
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from *FlexDisplayObject*)
numAutomationChildren	the number of automation children this container has. (Inherited from *FlexObject*)
numColumns	the total number of columns in the data available. (Inherited from *SparkSkinnableContainerBase*)
numElements	The number of visual elements in this container. (Inherited from *SparkSkinnableContainer*)
numRows	the total number of rows of data available. (Inherited from *SparkSkinnableContainerBase*)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from *FlexObject*)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from *FlexObject*)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from *FlexObject*)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from *FlexObject*)
showStatusBar	a value whether the status bar is visible.
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from *FlexDisplayObject*)
tabEnabled	whether this object is in the tab order. (Inherited from *FlexDisplayObject*)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from *FlexDisplayObject*)
Text	The text of the control. (Inherited from *TestObject*)
themeColor	the theme color of a component. (Inherited from *FlexObject*)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is `Nothing`. (Inherited from *FlexObject*)
transparent	a value whether the window is transparent.
url	The URL from which this Application's SWF file was loaded. (Inherited from *SparkApplication*)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from *FlexObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
viewSourceURL	the URL where the application's source can be viewed. (Inherited from *SparkApplication*)
visible	whether the display object is visible. (Inherited from *FlexDisplayObject*)
width	the width of the display object, in pixels. (Inherited from *FlexDisplayObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from *FlexDisplayObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeFocus	Changes the current focus. (Inherited from *FlexObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from *SparkSkinnableContainerBase*)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from *SparkSkinnableContainerBase*)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from *SparkSkinnableContainerBase*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)

Name	Description
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from *FlexDisplayObject*)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from *SparkSkinnableContainerBase*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from *IMoveable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from *FlexObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ToString	Returns a string representation of the control. (Inherited from *FlexDisplayObject*)
Type	Dispatched when the user presses a key. (Inherited from *SparkApplication*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Java SWT Class Reference

Lists the available classes for testing Java SWT controls.

CBanner Class

Description

The class used to layout the toolbar area and perspective switching toolbar in the workbench.

Inheritance Hierarchy

- *Control*
  - CBanner

Syntax

```
'Declaration
Public Class CBanner _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Bottom	The control located at the bottom of the banner.

Name	Description
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Left	The control located on the left side of the banner.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Right	The control located on the right side of the banner.
RightMinimumSize	The minimum size of the control located on the right side of the banner.
RightWidth	The width of the control located on the right side of the banner.
Simple	Whether the banner is rendered with a simple, traditional shape.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

CoolBar Class

Description
A container class that contains SWT widgets, primarily toolbars.

Inheritance Hierarchy

- *Control*
  - CoolBar

Syntax
```
'Declaration
Public Class CoolBar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the coolbar.
Items	A list of items in the coolbar.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

CoolItem Class

Description
Contains selectable user interface objects that represent the areas of a CoolBar that can be dynamically positioned.

Inheritance Hierarchy

- *Item*
  - CoolItem

Syntax

```
'Declaration
Public Class CoolItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

CTabFolder Class

Description
Class for an enhanced tab folder, typically having decorated tabs and the minimize, maximize, and close buttons.

Inheritance Hierarchy

- *Control*
  - CTabFolder

Syntax
```
'Declaration
Public Class CTabFolder _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the tab folder.
Items	A list of items in the tab folder.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	The index of the selected item.
SelectedItem	The selected tab item.
SelectedItemText	The text of the selected item or an empty string if no item is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the visible page.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Resizes the CTabFolder to its full (maximized) size.
Minimize	Resizes the CTabFolder to the minimum size allowed.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the CTabFolder to its previous size.
Select	Selects an item from the CTabFolder.

Name	Description
SelectList	Selects one or more items in the tab.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

CTabItem Class

Description
The class for an enhanced tab within a CTabFolder.

Inheritance Hierarchy

- *Item*
  - CTabItem

Syntax
```
'Declaration
Public Class CTabItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Selected	Whether the item is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the visible tab.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects a tab.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ExpandBar Class

Description
The class for widgets that expand and close by clicking on a header.

Inheritance Hierarchy

- *Control*
  - ExpandBar

Syntax
```
'Declaration
Public Class ExpandBar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
ExpandedItems	A list of the items that are expanded.
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)

Name	Description
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the expandbar.
Items	A list of items in the expandbar.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Collapse	Collapses the ExpandBar.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands an ExpandBar.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ExpandItem Class

Description
The class that contains the expandable items in an ExpandBar.

Inheritance Hierarchy

- *Item*
  - ExpandItem

Syntax

```
'Declaration
Public Class ExpandItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Content	The content of the item.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Expanded	Whether the item is expanded.
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Collapse	Collapses the expandable items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands the expandable items.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window pane that the sash borders.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SashForm Class

Description
The class for the border around a form that can be dragged to adjust the size of the form.

Inheritance Hierarchy
- *Control*
  - SashForm

Syntax
```
'Declaration
Public Class SashForm _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Horizontal	Whether the sash form is horizontal.
MaximizedControl	The sash window that is maximized in the form.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Vertical	Whether the sash form is vertical.
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
Weights	The relative sizes of the children of the sash form window.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ScrollableControl Class

Description
The implementation class for all controls which are only classified as controls but also contain a scrollbar.

Inheritance Hierarchy
- *Control*
  - ScrollableControl

Syntax
```
'Declaration
Public Class ScrollableControl _
Inherits Control
```

Properties
Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ScrolledComposite Class

Description
The class for scrollbars and scrolls the content when the user uses the scrollbars.

Inheritance Hierarchy
- *Control*
  - ScrolledComposite

Syntax
```
'Declaration
Public Class ScrolledComposite _
Inherits Control
```

Properties

Name	Description
AlwaysShowScrollBars	Whether the scrollbar shows.
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Origin	The point in the content that currently appears in the top left corner of the scrolled composite.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Shell Class

Description
The class for Java SWT windows.

Inheritance Hierarchy

- *Window*
  - Shell

Syntax

```
'Declaration
Public Class Shell _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from *Window*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Name	Description
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)

Name	Description
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Spinner Class

Description
The class to enter and modify numeric values for up/down controls.

Inheritance Hierarchy

- *Control*
  - Spinner

Syntax

```
'Declaration
Public Class Spinner _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
IncrementCount	The amount to increase the position value of the spinner control after pressing it.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	The internal page size of the spinner control.
Position	The position for the up/down control.
Range	The range of the spinner control.

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Decrement	Decreases the value when the spinner controls are pressed.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Increment	Increases the value when the spinner controls are pressed.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PageDecrement	Decreases the value when the page spinner controls are pressed.
PageIncrement	Increases the value when the page spinner controls are pressed.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetValue	Sets the value for the spinner control.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

StyledText Class

Description
The class for an editable user interface object that displays lines of text.

Inheritance Hierarchy

- *TextField*
  - StyledText

Syntax
```
'Declaration
Public Class StyledText _
Inherits TextField
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Editable	Whether the text is editable.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
IsPassword	Whether the control is a password text field. (Inherited from *TextField*)
MultiLine	Whether the control is multiline. (Inherited from *TextField*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	The position of the caret within the text field. (Inherited from *TextField*)
SelectedRange	The selected range within the text field. (Inherited from *TextField*)
SelectedText	The selected text within the text field. An empty string if no text is selected. (Inherited from *TextField*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearText	Removes all text from the text field. (Inherited from *TextField*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetMultiText	Returns the specified lines of text in the multi-line text field. (Inherited from *TextField*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetMultiText	Substitutes all or part of the lines in the multi-line text field. (Inherited from *TextField*)
SetPosition	Sets the insertion point in the text field. (Inherited from *TextField*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the specified range of the single-line or multi-line text field. (Inherited from *TextField*)
SetText	Substitutes new text for all or part of the text in the text field. (Inherited from *TextField*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTBrowser Class

Description
The class for the browser widget.

Inheritance Hierarchy

- *Control*
  - SWTBrowser

Syntax

```
'Declaration
Public Class SWTBrowser _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTDateTime Class

Description
The class for SWT date and time elements in a calendar, date, or time control.

Inheritance Hierarchy
- *Control*
  - SWTDateTime

Syntax
```
'Declaration
Public Class SWTDateTime _
Inherits Control
```

Properties
Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
CurrentDate	The current date.
Day	The day.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Hours	The hour.
Minutes	The minute.
Month	The month.

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Seconds	The second.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
Year	The year.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Select	Selects a date and time.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTabControl Class

Description
The class for SWT TabFolder.

Inheritance Hierarchy

- *TabControl*
  - SWTTabControl

Syntax
```
'Declaration
Public Class SWTTabControl _
Inherits TabControl
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the tab control. (Inherited from *TabControl*)
Items	A list of items in the tab control. (Inherited from *TabControl*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	The index of the selected item. (Inherited from *TabControl*)
SelectedItem	The selected item. (Inherited from *TabControl*)
SelectedTabItem	The name of the selected item.
TabItems	A list of TabItems in the tab control.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Sets the current page to the specified page. (Inherited from *TabControl*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTabItem Class

Description
The class for SWT TabItem.

Inheritance Hierarchy

- *Item*
  - SWTTabItem

Syntax

```
'Declaration
Public Class SWTTabItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Selected	Whether the item is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Select	Selects a tab.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTable Class

Description
The class for SWT tables.

Inheritance Hierarchy

- *Table*
  - SWTTable

Syntax

```
'Declaration
Public Class SWTTable _
Inherits Table
```

Properties

Name	Description
AllowsCheck	Whether the control can display a checkmark. (Inherited from *Table*)
AllowsMultiSelect	Whether the table supports selecting multiple items. (Inherited from *Table*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
ColumnCount	The number of columns in the table. (Inherited from *Table*)
ColumnItems	A list of all items in the column. (Inherited from *Table*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
RowCount	The number of rows in the table. (Inherited from *Table*)
RowItems	A list of all table rows in the table. (Inherited from *Table*)
SelectedIndices	The indices of the selected item(s). (Inherited from *Table*)
SelectedItems	The selected item(s). (Inherited from *Table*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the check box in the defined row of a table. (Inherited from *Table*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Double-clicks an item. (Inherited from *Table*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExtendSelectRow	Selects a range of rows. (Inherited from *Table*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
FocusRow	Focuses on a row in the table. (Inherited from *Table*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelectRow	Adds a row from the table to the set of selected rows. (Inherited from *Table*)
MultiUnselectRow	Removes a row from the set of selected rows. (Inherited from *Table*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectRow	Selects an row in the table. (Inherited from *Table*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box in the defined row of a table. (Inherited from *Table*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTableColumn Class

Description
The class for columns in an SWT table.

Inheritance Hierarchy

- *TableColumn*
  - SWTTableColumn

Syntax
```
'Declaration
Public Class SWTTableColumn _
Inherits TableColumn
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
Width	The width of the column. (Inherited from *TableColumn*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Resize	Resizes a column. (Inherited from *TableColumn*)
Select	Selects a column. (Inherited from *TableColumn*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTableRow Class

Description
The class for rows in an SWT table.

Inheritance Hierarchy

- *TableRow*
  - SWTTableRow

Syntax
```
'Declaration
Public Class SWTTableRow _
Inherits TableRow
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Checked	Whether the check box in the row is checked. (Inherited from *TableRow*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)

Name	Description
ItemCount	The number of items in the row. (Inherited from *TableRow*)
Items	A list of items in the row. (Inherited from *TableRow*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTree Class

Description
The class for SWT tree widgets.

Inheritance Hierarchy

- *Tree*

- SWTTree

Syntax

```
'Declaration
Public Class SWTTree _
Inherits Tree
```

Properties

Name	Description
AllowsCheck	Whether the control can display a checkmark. (Inherited from *Tree*)
AllowsMultiSelect	Whether the control supports selecting multiple items. (Inherited from *Tree*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
ColumnCount	The number of columns in the tree.
Columns	A list of columns in the tree.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the tree (including all children). (Inherited from *Tree*)
ItemPaths	A list of items in the tree (including all children). (Inherited from *Tree*)
Items	A list of items in the tree (including all children). (Inherited from *Tree*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	The index of the first selected item. (Inherited from *Tree*)
SelectedIndices	The indices of the selected item(s). (Inherited from *Tree*)
SelectedItem	The name of the first selected item. (Inherited from *Tree*)
SelectedItems	The names of the selected item(s). (Inherited from *Tree*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
VisibleItemPaths	A list of visible items in the tree (including all children). (Inherited from *Tree*)
VisibleItems	A list of visible items in the tree (including all children). (Inherited from *Tree*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the check box. (Inherited from *Tree*)
Click	Clicks on the object. (Inherited from *IClickable*)
Collapse	Collapses an item in a treeview control. (Inherited from *Tree*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Double-clicks an item. (Inherited from *Tree*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands an object in a treeview control. (Inherited from *Tree*)
ExtendSelect	Selects a range of items by extending the selection.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetContentsOfColumn	Retrieves the contents of the specified column as a list. To retrieve the contents of any column greater than column one, you must specify the parameters rawMode and column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetItemPaths	Returns all items of the tree as a list of itempaths (Inherited from *Tree*)

Name	Description
GetItemRect	Returns the size and position of an item relative to the treeview control. (Inherited from *Tree*)
GetItemsOfColumn	Retrieve items of the specified column from Tree
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetSelectedTextOfColumn	Retrieves selected text from the specified column
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsExpandable	Checks if the given item can be expanded. (Inherited from *Tree*)
IsExpanded	Checks if the given item is expanded. (Inherited from *Tree*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelect	Adds an item from the tree to the set of selected items.
MultiUnselect	Removes an item in the tree from the set of selected items.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects an item from the tree. (Inherited from *Tree*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box. (Inherited from *Tree*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SWTTreeColumn Class

Description
The class for columns in a Tree widget.

Inheritance Hierarchy

- *Item*
  - SWTTreeColumn

Syntax

```
'Declaration
Public Class SWTTreeColumn _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
Width	The width of the column.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Resize	Resizes a column of the tree.
Select	Selects a tree column.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ViewForm Class

Description
The class to lay out a view's label/menu/toolbar local bar in the workbench.

Inheritance Hierarchy

- *Control*
  - ViewForm

Syntax
```
'Declaration
Public Class ViewForm _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
TopCenter	The window located in the top center of the pane.
TopLeft	The window located in the top left of the pane.
TopRight	The window located in the top right of the pane.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Keyword-Driven Testing Class Reference

Lists the available classes for keyword-driven testing.

ArgumentAttribute Class

Description

Used to explicitly specify the name of an argument of a method that is marked as a keyword for keyword-driven testing.

Syntax

```
<AttributeUsageAttribute(AttributeTargets.Parameter>
Public Class ArgumentAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (ArgumentAttribute)	Gets the name of the argument.

Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments `username` and `password`:

```
<Keyword()>
Public Sub Login(<Argument("Name of the user")> username As
String, <Argument("Password of the user")> password As String)
  ' keyword implementation
End Sub
```

Example: Using arguments without a description

Use one of the following code samples to create the keyword *Login* with the arguments `username` and `password`, without using a description for the arguments:

```
<Keyword()>
Public Sub Login(username As String, password As String)
  ' keyword implementation
End Sub
```

```
<Keyword()>
Public Sub Login(<Argument> username As String, <Argument>
password As String)
  ' keyword implementation
End Sub
```

KeywordAttribute Class

Description

Specifies that a method is a keyword. If the name of the keyword is not specified the name of the annotated method is used as the keyword name.

Syntax

```
'Declaration
<AttributeUsageAttribute(AttributeTargets.Method>
Public Class KeywordAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (KeywordAttribute)	Gets the name of the keyword. The default value is an empty string.
Description Property (KeywordAttribute)	Gets the description of the keyword. The default value is an empty string.

Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments `username` and `password`:

```
<Keyword()>
Public Sub Login(username As String, password As String)
  ' keyword implementation
End Sub
```

Example: Specifying a keyword name

To specify the keyword name when creating a new keyword, use the following code sample:

```
<Keyword("Login user")>
Public Sub Login(username As String, password As String)
  ' keyword implementation
End Sub
```

KeywordGroupAttribute Class

Description

Specifies that a class is a keyword group. Methods within this class that are marked as keywords are keywords. The qualified name of these methods consists of the name of the keyword group and the name of the keyword. If the keyword group has no name, the simple name of the declaring class is used instead.

Syntax

```
'Declaration
<AttributeUsageAttribute(AttributeTargets.Class>
Public Class KeywordGroupAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (KeywordGroupAttribute)	Gets the name of the keyword group. The default value is an empty string.

Example: Creating a keyword group

Use the following code sample to create the keyword group *LoginPage*:

```
<KeywordGroup()>
Public Class LoginPage
  ' keyword methods
End Class
```

Example: Specifying the name of the keyword group

Use one of the following code samples to create the keyword *Login* with the arguments `username` and `password`, without using a description for the arguments:

```
<KeywordGroup("Login Page")>
Public Class LoginPage
  ' keyword methods
End Class
```

Mobile Class Reference

Lists the available classes for testing Mobile controls.

IMobileClickable Interface

Description
Interface for objects that use clicks.

Syntax

```
'Declaration
Public Class IMobileClickable
```

Methods

Name	Description
Click	Clicks on the device at the specified coordinates.
DoubleClick	Double-clicks on the device at the specified coordinates.
LongClick	Long-clicks on the device at the specified coordinates.

IMobileGestures Interface

Description
Interface for objects that use long swipes.

Syntax

```
'Declaration
Public Class IMobileGestures
```

Methods

Name	Description
Drag	Performs a drag operation between the two specified points.
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time.
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image.
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image.
Swipe	Performs a swipe between the two specified points.
SwipeDown	Performs a down-swipe.
SwipeLeft	Performs a left-swipe.

Name	Description
SwipeRight	Performs a right-swipe.
SwipeUp	Performs a up-swipe.
SwipeWithSegments	Performs a swipe between the specified points.
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time.

IMobileKeyable Interface

Description
Interface for objects that use keystrokes.

Syntax
```
'Declaration
Public Class IMobileKeyable
```

Methods

Name	Description
TypeKeys	Sends a set of keystrokes to the object.

MobileButton Class

Description
Represents a mobile button. Mobile buttons can be clicked.

Inheritance Hierarchy

- *MobileObject*
  - MobileButton

Syntax
```
'Declaration
Public Class MobileButton _
Inherits MobileObject
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled. (Inherited from *MobileObject*)
IsFocused	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from *MobileObject*)
IsSelected	Whether the mobile object is selected or checked. (Inherited from *MobileObject*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
Drag	Performs a drag operation between the two specified points. (Inherited from *IMobileGestures*)
DragTo	Drags this object to the specified point relative to the mobile device. (Inherited from *MobileObject*)
DragToObject	Drags this object to the specified destination object. (Inherited from *MobileObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from *IMobileGestures*)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from *IMobileGestures*)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from *IMobileGestures*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Swipe	Performs a swipe between the two specified points. (Inherited from *IMobileGestures*)
SwipeDown	Performs a down-swipe. (Inherited from *IMobileGestures*)
SwipeLeft	Performs a left-swipe. (Inherited from *IMobileGestures*)
SwipeRight	Performs a right-swipe. (Inherited from *IMobileGestures*)
SwipeUp	Performs a up-swipe. (Inherited from *IMobileGestures*)

Name	Description
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from *IMobileGestures*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from *IMobileGestures*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IMobileKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

MobileDevice Class

Description
The mobile device.

Inheritance Hierarchy

- *TestObject*
  - MobileDevice

Syntax
```
'Declaration
Public Class MobileDevice _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

Properties

Name	Description
DeviceId	The id of the device for the current connection.
DisplayHeight	The height of the display in pixels.
DisplayOrientation	The current orientation of the device.
DisplayWidth	The width of the display in pixels.
IsEmulator	Whether the connected device is an emulator.
Model	The device name of the connected device.
OperatingSystem	the operating system of the mobile device, Android or iOS
OsVersion	The version of the operating system of the connected device.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)

Name	Description
CloseApp	Closes the app and releases the device, to make it available to other users.
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
Drag	Performs a drag operation between the two specified points. (Inherited from *IMobileGestures*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateConnectionString	Generates a connection string for this mobile device.
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from *IMobileGestures*)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from *IMobileGestures*)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from *IMobileGestures*)
PressBack	Presses the back button. This method is not supported on iOS.
PressDelete	Presses the delete button.
PressEnter	Presses the enter button.
PressHome	Presses the home button.
PressKeyCode	Presses a certain Android-specific key code. This method is not supported on iOS.
PressRecentApps	Presses the recent apps button.
Rotate	Simulates rotating the device screen.
SetLocation	Sets the geographic location of the device, this method only works on Android devices (physical or emulated) and iOS simulators.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Sleep	Presses the power button if the screen is on. This method is not supported on iOS.
Swipe	Performs a swipe between the two specified points. (Inherited from *IMobileGestures*)
SwipeDown	Performs a down-swipe. (Inherited from *IMobileGestures*)
SwipeLeft	Performs a left-swipe. (Inherited from *IMobileGestures*)
SwipeRight	Performs a right-swipe. (Inherited from *IMobileGestures*)
SwipeUp	Performs a up-swipe. (Inherited from *IMobileGestures*)
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from *IMobileGestures*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from *IMobileGestures*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IMobileKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WakeUp	Presses the power button if the screen is off. This method is not supported on iOS.

MobileObject Class

Description
The base class for all mobile objects.

Inheritance Hierarchy

- *TestObject*
  - MobileObject
    - *MobileButton*
    - *MobileTextField*
    - *MobileWindow*

Syntax
```
'Declaration
Public Class MobileObject _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled.
IsFocused	Whether the mobile object has focus. This property is not supported on iOS.
IsSelected	Whether the mobile object is selected or checked.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)

Name	Description
Drag	Performs a drag operation between the two specified points. (Inherited from *IMobileGestures*)
DragTo	Drags this object to the specified point relative to the mobile device.
DragToObject	Drags this object to the specified destination object.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from *IMobileGestures*)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from *IMobileGestures*)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from *IMobileGestures*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Swipe	Performs a swipe between the two specified points. (Inherited from *IMobileGestures*)
SwipeDown	Performs a down-swipe. (Inherited from *IMobileGestures*)
SwipeLeft	Performs a left-swipe. (Inherited from *IMobileGestures*)
SwipeRight	Performs a right-swipe. (Inherited from *IMobileGestures*)
SwipeUp	Performs a up-swipe. (Inherited from *IMobileGestures*)
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from *IMobileGestures*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from *IMobileGestures*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IMobileKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

MobileTextField Class

Description
Represents a text field.

Inheritance Hierarchy

- *MobileObject*
  - MobileTextField

Syntax
```
'Declaration
Public Class MobileTextField _
Inherits MobileObject
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled. (Inherited from *MobileObject*)

Name	Description
IsFocused	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from *MobileObject*)
IsSelected	Whether the mobile object is selected or checked. (Inherited from *MobileObject*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearText	Clears all the content from the text field.
Click	Clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
Drag	Performs a drag operation between the two specified points. (Inherited from *IMobileGestures*)
DragTo	Drags this object to the specified point relative to the mobile device. (Inherited from *MobileObject*)
DragToObject	Drags this object to the specified destination object. (Inherited from *MobileObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from *IMobileGestures*)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from *IMobileGestures*)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from *IMobileGestures*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
SetText	Substitutes new text for the text in the text field.
Swipe	Performs a swipe between the two specified points. (Inherited from *IMobileGestures*)
SwipeDown	Performs a down-swipe. (Inherited from *IMobileGestures*)
SwipeLeft	Performs a left-swipe. (Inherited from *IMobileGestures*)
SwipeRight	Performs a right-swipe. (Inherited from *IMobileGestures*)
SwipeUp	Performs a up-swipe. (Inherited from *IMobileGestures*)
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from *IMobileGestures*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from *IMobileGestures*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IMobileKeyable*)
TypePasswordKeys	Types an encrypted password into a text field.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

MobileWindow Class

Description
The mobile window.

Inheritance Hierarchy

- *MobileObject*
  - MobileWindow

Syntax

```
'Declaration
Public Class MobileWindow _
Inherits MobileObject
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled. (Inherited from *MobileObject*)
IsFocused	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from *MobileObject*)
IsSelected	Whether the mobile object is selected or checked. (Inherited from *MobileObject*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
Drag	Performs a drag operation between the two specified points. (Inherited from *IMobileGestures*)
DragTo	Drags this object to the specified point relative to the mobile device. (Inherited from *MobileObject*)
DragToObject	Drags this object to the specified destination object. (Inherited from *MobileObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from *IMobileClickable*)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from *IMobileGestures*)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from *IMobileGestures*)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from *IMobileGestures*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Swipe	Performs a swipe between the two specified points. (Inherited from *IMobileGestures*)
SwipeDown	Performs a down-swipe. (Inherited from *IMobileGestures*)
SwipeLeft	Performs a left-swipe. (Inherited from *IMobileGestures*)
SwipeRight	Performs a right-swipe. (Inherited from *IMobileGestures*)
SwipeUp	Performs a up-swipe. (Inherited from *IMobileGestures*)
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from *IMobileGestures*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from *IMobileGestures*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IMobileKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Rumba Class Reference

Lists the available classes for testing Rumba controls.

Rumba Keys

Description
Contains the string constants for the Rumba key mnemonics which can be used in the `SendKeys` and `SynchSendKeys` methods of the `RumbaObject` class.

Includes the following string constants:

String Constant	Key Mnemonic
At	@@
Alt	@A
AltCursor	@e@1*
Attention	@A@Q
Backspace	@B
Backtab	@B
Clear	@C
Cmd	@A@Y
CursorDown	@V
CursorLeft	@L
CursorRight	@Z
CursorSelect	@e@1*
CursorUp	@U
Delete	@D
Dup	@S@x
End	@q
Enter	@E
EraseEof	@F
EraseEol	@e@d
EraseInput	@A@F
FieldExit	@A@E
FieldMark	@S@y
FieldMinus	@A@-
FieldPlus	@A@+
Help	@H
Hexadecimal	@A@X
Home	@0
Insert	@I
InsertToggle	@A@I
LocalHelp	@e@l
LocalPrint	@P
LocalHelpCursor	@e@m*
LeftTab	@B
NewLine	@e@n*
PageUp	@u
PageDown	@v

String Constant	Key Mnemonic
Print	@A@t
PrintScreen	@A@T
RecordBackspace	@A@<
Reset	@R

RumbaCharacterAttribute Data Type

Represents the character attributes of an on-screen character.

Can include the following character attributes:

Attribute	Description
backgroundColor	The background color of the character.
foregroundColor	The foreground color of the character.
column	The column of the character on the screen.
line	The line of the character on the screen.
autoEnter	Defines if the character is part of an auto-enter text.
autoSkip	Defines if the character is part of an auto-skip text.
blinking	Defines if the character is blinking.
bold	Defines if the character is bold.
columnSeparator	Defines if the character is a column separator.
detectable	Defines if the character is part of a detectable text.
hidden	Defines if the character is part of a hidden text.

Attribute	Description
protect	Defines if the character is part of a protected text.
reverseVideo	Defines if the character is displayed in reverse video.
underlined	Defines if the character is underlined.

For additional information, see *IRDEAttribute Properties* in the Rumba Developer Edition (RDE) documentation.

RumbaField Class

Description
Represents a field on the green screen.

Inheritance Hierarchy

- *RumbaObject*
  - RumbaField
    - *RumbaLabel*
    - *RumbaTextField*

Syntax

```
'Declaration
Public Class RumbaField _
Inherits RumbaObject
```

Properties

Name	Description
AutoEnter	A value that indicates true if the field is an AutoEnter field.
AutoSkip	A value that is true if the field is an AutoSkip field.
Detectable	A value is indicates true if the field is detectable.
Dup	A value that indicates true if the field is a dup field.
EndColumn	A value that indicates the ending column of the field.
EndLine	A value that indicates the ending line of the field.
EndPosition	The 1-based end position of the field, when the screen is seen as one sequence of characters.
Enptui	A value that indicates true if the field is an ENPTUI field.
FieldExitRequired	A value that indicates true if the field is required before exiting the screen.
Hidden	A value that indicates if the field is hidden.
Intense	A value that indicates true if the field is intense.
Length	The length of the field.
ModifiedDataTag	A value that indicates true if the field has the ModifiedDataTag property set.

Name	Description
Protected	A value that indicates true if the field is protected (i.e. a RumbaLabel).
StartColumn	A value that indicates the column in which the field begins.
StartLine	A value that indicates the line in which the field begins.
StartPosition	The 1-based start position of the field, when the screen is seen as one sequence of characters.
Text	The text of the control. (Inherited from *TestObject*)
Type	A value that represents the input allowed for this field.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
