Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCharacterAttributes	Gets the character attributes for this field's characters.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

RumbaLabel Class

Description
A field in the screen whose text can be only be retrieved but not set.

Inheritance Hierarchy

- *RumbaField*
  - RumbaLabel

Syntax
```
'Declaration
Public Class RumbaLabel _
Inherits RumbaField
```

Properties

Name	Description
AutoEnter	A value that indicates true if the field is an AutoEnter field. (Inherited from *RumbaField*)
AutoSkip	A value that is true if the field is an AutoSkip field. (Inherited from *RumbaField*)
Detectable	A value is indicates true if the field is detectable. (Inherited from *RumbaField*)
Dup	A value that indicates true if the field is a dup field. (Inherited from *RumbaField*)
EndColumn	A value that indicates the ending column of the field. (Inherited from *RumbaField*)
EndLine	A value that indicates the ending line of the field. (Inherited from *RumbaField*)
EndPosition	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from *RumbaField*)
Enptui	A value that indicates true if the field is an ENPTUI field. (Inherited from *RumbaField*)
FieldExitRequired	A value that indicates true if the field is required before exiting the screen. (Inherited from *RumbaField*)
Hidden	A value that indicates if the field is hidden. (Inherited from *RumbaField*)
Intense	A value that indicates true if the field is intense. (Inherited from *RumbaField*)
Length	The length of the field. (Inherited from *RumbaField*)
ModifiedDataTag	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from *RumbaField*)
Protected	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from *RumbaField*)

Name	Description
StartColumn	A value that indicates the column in which the field begins. (Inherited from *RumbaField*)
StartLine	A value that indicates the line in which the field begins. (Inherited from *RumbaField*)
StartPosition	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from *RumbaField*)
Text	The text of the control. (Inherited from *TestObject*)
Type	A value that represents the input allowed for this field. (Inherited from *RumbaField*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCharacterAttributes	Gets the character attributes for this field's characters. (Inherited from *RumbaField*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

RumbaObject Class

Description
RumbaObject.

Inheritance Hierarchy

- *TestObject*
  - RumbaObject
    - *RumbaField*
    - *RumbaScreen*

Syntax

```
'Declaration
Public Class RumbaObject _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable
```

Properties

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

RumbaScreen Class

Description
Represents the whole green screen.

Inheritance Hierarchy

- *RumbaObject*
  - RumbaScreen

Syntax

```
'Declaration
Public Class RumbaScreen _
Inherits RumbaObject
```

Properties

Name	Description
BackgroundColor	the background color of the display control.
CharacterSetId	a value that identifies the character set translation table used by the Display control.
ColumnCount	a value that indicates the number of columns on the current screen.
CursorColumn	the column position of the cursor on the screen.
CursorLine	the line position of the cursor on the screen.
CursorPosition	The current cursor position on the screen. Values are starting with 1 for the first line or column.
HostConnected	a value that indicates if the host is connected.
HostDeviceName	the host device name.
HostIpAddress	the host IP address.
KeyboardLocked	a value that indicates whether keyboard input is inhibited.
LineCount	a value that indicates the number of lines on the current screen.
ScreenId	the screen id.
ScreenSize	the size of the screen in text lines and columns.
SessionName	the session name.

Name	Description
SupportsStructuredFields	a value that indicates if the host supports structured field decoding.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Clears the screen by sending the "clear" key. Equivalent to synchSendKeys(RumbaKey.CLEAR).
Click	Clicks on the object. (Inherited from *IClickable*)
Connect	Connects to the hosts in the current configuration.
Disconnect	Disconnects the current connection.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCharacterAttributes	Gets the character attributes for length-number of characters starting at the given position.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetContent	Retrieves a string containing the screen without line breaks starting at the specified text position.

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetLines	Retrieves a clipping of the screen and returns the selected lines in a list of strings.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
Reset	Resets the screen by sending the "reset" key. Equivalent to synchSendKeys(RumbaKey.RESET).
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
SetCursorPosition	Moves the cursor to the given position of the screen.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Submit	Submits the entered data to the server by sending the "submit" key. Equivalent to synchSendKeys(RumbaKey.SUBMIT).
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForHostConnected	Waits until the session is connected.
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WriteText	Writes text on the screen.

RumbaTextField Class

Description
A field in the screen whose text can be both retrieved and set.

Inheritance Hierarchy

- *RumbaField*
  - RumbaTextField

Syntax
```
'Declaration
Public Class RumbaTextField _
Inherits RumbaField
```

Properties

Name	Description
AutoEnter	A value that indicates true if the field is an AutoEnter field. (Inherited from *RumbaField*)
AutoSkip	A value that is true if the field is an AutoSkip field. (Inherited from *RumbaField*)
Detectable	A value is indicates true if the field is detectable. (Inherited from *RumbaField*)
Dup	A value that indicates true if the field is a dup field. (Inherited from *RumbaField*)
EndColumn	A value that indicates the ending column of the field. (Inherited from *RumbaField*)
EndLine	A value that indicates the ending line of the field. (Inherited from *RumbaField*)
EndPosition	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from *RumbaField*)
Enptui	A value that indicates true if the field is an ENPTUI field. (Inherited from *RumbaField*)

Name	Description
FieldExitRequired	A value that indicates true if the field is required before exiting the screen. (Inherited from *RumbaField*)
Hidden	A value that indicates if the field is hidden. (Inherited from *RumbaField*)
Intense	A value that indicates true if the field is intense. (Inherited from *RumbaField*)
Length	The length of the field. (Inherited from *RumbaField*)
ModifiedDataTag	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from *RumbaField*)
Protected	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from *RumbaField*)
StartColumn	A value that indicates the column in which the field begins. (Inherited from *RumbaField*)
StartLine	A value that indicates the line in which the field begins. (Inherited from *RumbaField*)
StartPosition	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from *RumbaField*)
Text	The text of the control. (Inherited from *TestObject*)
Type	A value that represents the input allowed for this field. (Inherited from *RumbaField*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCharacterAttributes	Gets the character attributes for this field's characters. (Inherited from *RumbaField*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetText	Sets the text field's text.
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from *RumbaObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SAP Class Reference

Lists the available classes for testing SAP controls.

ISapContextMenuable Interface

Description
Interface for any Component which supports ContextMenu selections.

Syntax

```
'Declaration
Public Class ISapContextMenuable
```

Methods

Name	Description
SelectContextMenuItem	Select an item from the controls context menu.
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item.
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus.

SapBarChart Class

Description
Class for SAP Bar Chart.

Inheritance Hierarchy

- *SapShell*
  - SapBarChart

Syntax

```
'Declaration
Public Class SapBarChart _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
ChartCount	the number of charts.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)

Name	Description
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
BarCount	Returns the number of bars in the given chart.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetBarContent	Returns the content of the bar.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetGridLineContent	Returns the content of the grid line.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GridCount	Returns the number of grids within the chart.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
LinkCount	Returns the number of links within the given chart.
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SendData	Send data to the server.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapBox Class

Description
Class for SAP SapBox.

Inheritance Hierarchy

- *SapComponent*
  - SapBox

Syntax

```
'Declaration
Public Class SapBox _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapButton Class

Description
SapButton class is the class for push buttons.

Inheritance Hierarchy

- *SapComponent*
  - SapButton

Syntax

```
'Declaration
Public Class SapButton _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CharHeight	the height of the element in character metric.
CharLeft	the left coordinate of the element in character metric.
CharTop	the top coordinate of the element in character metric.
CharWidth	the width of the element in character metric.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)

Name	Description
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Select	This emulates manually pressing a button. Pressing a button will always cause server communication to occur, rendering all references to elements below the window level invalid.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapCalendar Class

Description
SapCalendar class represents a SapCalendar.

Inheritance Hierarchy

- *SapShell*
  - SapCalendar

Syntax

```
'Declaration
Public Class SapCalendar _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
Day	The day of the month that is currently selected.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
EndSelection	The end of the selection interval.
FirstVisibleDate	the earliest date visible in the calendar control.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
LastVisibleDate	the last date visible in the calendar control.
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Month	The month of the year that is currently selected.
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
SelectionInterval	The interval that is currently selected.
StartSelection	The start of the selection interval.
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Week	The week of the year that is currently selected.
Width	the current width of the component. (Inherited from *SapComponent*)
Year	The year that is currently selected.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ContextMenu	Opens a context menu.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SetFirstVisibleDate	Sets the earliest date visible in the calendar control.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetFocusDate	Sets the date to be focused.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionInterval	Selects the specified interval.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapChart Class

Description
Class for SAP Chart.

Inheritance Hierarchy

- *SapShell*
  - SapChart

Syntax

```
'Declaration
Public Class SapChart _
```

```
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
ValueChange	Changes a value of the chart.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapCheckBox Class

Description
SapCheckBox class is the class for check box controls.

Inheritance Hierarchy

- *SapComponent*
  - SapCheckBox

Syntax
```
'Declaration
Public Class SapCheckBox _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)

Name	Description
CharHeight	the height of the element in character metric.
CharLeft	the left coordinate of the element in character metric.
CharTop	the top coordinate of the element in character metric.
CharWidth	the width of the element in character metric.
Checked	whether the checkbox is checked.
ColorIndex	the index of the list color of this element.
ColorIntensified	whether the Intensified flag is set in screen painter for this element.
ColorInverse	whether the inverse color style is set in screen painter for the element.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Flushing	whether the value change causes a round trip.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsLeftLabel	whether the component has the 'assign left' flag.
IsListElement	whether the element is on an ABAP list, not a screen.
IsRightLabel	whether the component has the 'assign right' flag.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
RowText	the text of the while line containing the current component.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the check box.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Uncheck	Un-checks the check box.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapColorSelector Class

Description
SapColorSelector class represents a SapColorSelector.

Inheritance Hierarchy

- *SapShell*
  - SapColorSelector

Syntax
```
'Declaration
Public Class SapColorSelector _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)

Name	Description
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapComboBox Class

Description
Class for SAP ComboBox.

Inheritance Hierarchy

- *SapComponent*
  - SapComboBox

Syntax
```
'Declaration
Public Class SapComboBox _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CharHeight	the height of the element in character metric.
CharLeft	the left coordinate of the element in character metric.
CharTop	the top coordinate of the element in character metric.
CharWidth	the width of the element in character metric.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Flushing	whether the value change causes a round trip.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsLeftLabel	whether the component has the 'assign left' flag.
IsListBoxActive	whether the list box of the the combo box is currently open.

Name	Description
IsRightLabel	whether the component has the 'assign right' flag.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Key	the key of the currently selected item.
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
Required	whether the component is a required value for the screen.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCurrentEntryKey	the key of the current entry.
GetCurrentEntryValue	the value of the current entry.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetEntryKeys	a list of all entry keys.
GetEntryValues	a list of all entry values.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SelectItem	Selects the specified item.
SelectKey	Selects the list item with the specified key.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapComponent Class

Description
SapComponent class is the base class for SAP.

Inheritance Hierarchy

- *TestObject*
  - SapComponent
    - *SapBox*
    - *SapButton*
    - *SapCheckBox*
    - *SapComboBox*
    - *SapContainer*
    - *SapContainerShell*
    - *SapCustomControl*
    - *SapDockShell*
    - *SapLabel*
    - *SapMenu*
    - *SapMenubar*
    - *SapOkCodeField*
    - *SapRadioButton*
    - *SapScrollContainer*
    - *SapShell*
    - *SapSimpleContainer*
    - *SapSplitterContainer*
    - *SapStatusbar*
    - *SapTab*
    - *SapTable*
    - *SapTabStrip*
    - *SapTextField*
    - *SapTitlebar*
    - *SapToolbar*
    - *SapUserArea*
    - *SapWindow*

Syntax

```
'Declaration
Public Class SapComponent _
Inherits TestObject _
Implements IFocusable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support.
AccessibilityTextOnRequest	an additional text for accessibility support.
AccessibilityTooltip	an additional tooltip text for accessibility support.
Changeable	whether an object is changeable.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type.
Height	the current height of the component.

Name	Description
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font.
Left	the left position of the element in screen coordinates.
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system.
Name	the name of the component.
ScreenLeft	the left position of the component in screen coordinates.
ScreenTop	the top position of the component in screen coordinates.
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text.
Top	the top coordinate of the element in screen coordinates.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapContainer Class

Description
Class for SAP Container.

Inheritance Hierarchy

- *SapComponent*
  - SapContainer

Syntax

```
'Declaration
Public Class SapContainer _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)

Name	Description
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapDockShell Class

Description
Class for SAP DockShell.

Inheritance Hierarchy

- *SapComponent*
  - SapDockShell

Syntax

```
'Declaration
Public Class SapDockShell _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapGridView Class

Description
Class for SAP GridView. Some of the methods that have Get as a prefix require the column as an iput parameter of type string. This parameter is different for each individual GridView element. To obtain the value of this parameter, record an action on the desired item and use the parameter that you have recorded.

Inheritance Hierarchy

- *SapShell*
  - SapGridView

Syntax

```
'Declaration
Public Class SapGridView _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
ColumnCount	the number of columns.
ColumnOrder	a list of strings which contains all the column identifiers in the order in which they are displayed.
CurrentCellColumn	the current column.
CurrentCellRow	the current row.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
FirstVisibleColumn	the first visible column of the scrollable area of the grid view, fixed columns are ignored.
FirstVisibleRow	the index of the first visible row in the grid.
FrozenColumnCount	the number of columns that are excluded from horizontal scrolling.

Name	Description
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
RowCount	the number of rows.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
SelectedCells	a list of strings that contains the selected cells, each of which has the format "<row>,<column id>".
SelectedColumns	a list of strings of currently selected columns.
SelectedRows	a comma separated list of row index numbers or index ranges, such as "1,4,6-8".
SelectionMode	the selection mode. Possible values are: "RowsAndColumns", "ListboxSingle", ListboxMultiple", "Free".
Text	The text of the control. (Inherited from *TestObject*)
Title	the title of the grid control.
ToolbarButtonCount	the number of tool bar buttons (separators included).
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VisibleRowCount	the number of visible rows of the grid view.
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearSelection	Removes all row, column and cell selections.
Click	Clicks on the specified cell.
ClickCurrentCell	Clicks the current cell.
ContextMenu	Requests the context menu.
CurrentCellMoved	This function notifies the server that another cell was made the current cell. The function must be called whenever the current cell changes.
DeleteRows	Delete the given rows.
DeselectColumn	Removes the specified column from the list of selected columns.
DoubleClick	Double clicks the specified cell.
DoubleClickCurrentCell	Double clicks on the current cell.
DuplicateRows	Duplicates the given range of rows
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCellColor	Returns an identifier for the color of the cell.
GetCellHeight	Gets the height of the cell in pixels.
GetCellIcon	Gets the icon string of the specified cell.
GetCellLeft	Gets the left position of the cell.
GetCellMaxLength	Gets the maximum length of the cell in number of bytes.
GetCellState	Gets the state of the specified cell. Possible values are: Normal, Error, Warning, Info.
GetCellTooltip	Gets the tooltip of the specified cell.
GetCellTop	Gets the top position of the specified cell.
GetCellType	Gets the cell type of the specified cell.

Name	Description
GetCellValue	Gets the value of the specified cell.
GetCellWidth	Gets the width of the specified cell.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColorInfo	Returns the description for the color of the cell.
GetColumnDataType	Gets the data type of the column.
GetColumnPosition	Gets the position of the specified column.
GetColumnSortType	Gets the sort type of the column. Possible values are: None, Ascending, Descending.
GetColumnTitles	Gets all column titles of the specified column.
GetColumnTooltip	Gets the tool tip text of the specified column.
GetColumnTotalType	Gets the total type of the column. Possible values are: None, Total, Subtotal.
GetDisplayedColumnTitle	Gets the currently displayed title of the specified column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetRowTotalLevel	Gets the level of the row.
GetSymbolInfo	Returns the description for the symbol in the cell.
GetToolbarButtonIcon	Gets the name of the icon of the specified toolbar button.
GetToolbarButtonId	Gets the ID of the specified tool bar button.
GetToolbarButtonText	Gets the text of the specified tool bar button.
GetToolbarButtonTooltip	Gets the tooltip of the specified tool bar button
GetToolbarButtonType	Gets the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox".
GetToolbarFocusButton	Gets the position of the current focused tool bar button
HasCellF4Help	Returns true if the specified cell has a value help assigned.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
InsertRows	Inserts a range of rows
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsCellChangeable	Returns true if the specified cell is changeable.
IsCellCheckBoxChecked	Returns true if the check box at the specified position is checked.
IsCellHotspot	Returns true if the cell is a link.
IsCellSymbol	Returns true if the text in the cell is displayed in the SAP symbol font.
IsCellTotalExpander	Returns true if the specified cell contains a total expander button.
IsColumnFiltered	Returns true if the specified column is filtered.
IsColumnKey	Returns true if the specified column is a key column.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsToolbarButtonChecked	Returns true if the specified tool bar button is checked.
IsToolbarButtonEnabled	Returns true if the specified button is enabled.
IsTotalRowExpanded	whether the specified total row is expanded.
ModifyCell	Modifies the value of the specified cell.
ModifyCheckBox	Modifies the value of the specified checkbox cell.
MoveRows	Moves the rows with an index greater than or equal to fromRow up to an index less than or equal to toRow to the position of destRow.
PressButton	Presses the button placed in the specified cell.
PressButtonCurrentCell	Clicks a button placed in the current cell.
PressColumnHeader	Clicks on the header of the specified column.
PressEnter	Presses the enter key.
PressF1	Presses the F1 key.
PressF4	Presses the F4 key.
PressToolbarButton	Clicks the specified button in the grid view's tool bar.

Name	Description
PressToolbarContextButton	Opens the context menu of the specified button of the grid view's tool bar.
PressTotalRow	Presses the row button of the specified total row.
PressTotalRowCurrentCell	Presses the expansion button on the current cell.
SelectAll	Selects the whole grid content (i.e. all rows and all columns).
SelectColumn	Adds the specified column to the list of the selected columns.
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SelectionChanged	Notifies the server that the selection has changed
SelectToolbarMenuItem	Selects an item from the context menu of the grid view's tool bar.
SetColumnOrder	Sets the order of the columns.
SetColumnWidth	Sets the width of the specified column.
SetCurrentCell	Sets the specified cell as the current cell.
SetCurrentCellColumn	Specifies the column of the current cell.
SetCurrentCellRow	Sets the row of the current cell.
SetFirstVisibleColumn	Sets the first visible column.
SetFirstVisibleRow	Sets the first visible row.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectedRows	Selects the specified rows.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TriggerModified	Notifies the server of multiple changes in cells. Typically this method should be called after multiple calls to ModifyCell.

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapHorizontalScrollBar Class

Description
Class for horizontal scrollbars.

Inheritance Hierarchy

- *SapScrollbar*
  - SapHorizontalScrollBar

Syntax

```
'Declaration
Public Class SapHorizontalScrollBar _
Inherits SapScrollbar
```

Properties

Name	Description
Maximum	the maximum scrollbar value. (Inherited from *SapScrollbar*)
Minimum	the minimum scrollbar value. (Inherited from *SapScrollbar*)
PageSize	the scrollbar pagesize. (Inherited from *SapScrollbar*)
Position	the current scrollbar position. (Inherited from *SapScrollbar*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
ScrollTo	Scrolls to the given position. (Inherited from *SapScrollbar*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapHTMLViewer Class

Description
Class for SAP HTMLView.

Inheritance Hierarchy

- *SapShell*
  - SapHTMLViewer

Syntax

```
'Declaration
Public Class SapHTMLViewer _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.

Name	Description
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DocumentComplete	whether the document is complete.
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
ContextMenu	Emulates the context menu request. Applies only to context menus provided by the backend.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SapEvent	This function submits an HTML form to the backend.
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapLabel Class

Description
SapLabel class is the class for all SAP labels.

Inheritance Hierarchy

- *SapComponent*
  - SapLabel

Syntax
```
'Declaration
Public Class SapLabel _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CharLeft	the left coordinate of the label in character metric.
CharTop	the top coordinate of the label in character metric.
CharWidth	the width of the element in character metric.
ColorIndex	the color index of the label.
ColorInverse	whether the inverse color style is set for the label.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DisplayedText	the text of the label.

Name	Description
Height	the current height of the component. (Inherited from *SapComponent*)
Highlighted	whether the label has the 'highlighted' flag assigned.
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsHotspot	whether a mouse click on the label causes a round trip.
IsLeftLabel	whether the component has the 'assign left' flag assigned.
IsListElement	whether the element is on an ABAP list.
IsRightLabel	whether the component has the 'assign right' flag assigned.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Maxlength	the maximum text length of the label in code units.
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
Numerical	whether the label may only contain numbers.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapNetPlan Class

Description
Class for SAP Net Chart.

Inheritance Hierarchy

- *SapShell*
  - SapNetPlan

Syntax

```
'Declaration
Public Class SapNetPlan _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
LinkCount	the number of links in the net.

Name	Description
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
NodeCount	the number of Nodes in the net.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetLinkContent	Returns the content of the link.
GetNodeContent	Returns the content of the node.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SendData	This function emulates the output of each action triggered at the control side. The result of the action is sent to the server.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapOfficeIntegration Class

Description
Class for SAP OfficeIntegration.

Inheritance Hierarchy

- *SapShell*
  - SapOfficeIntegration

Syntax

```
'Declaration
Public Class SapOfficeIntegration _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapOkCodeField Class

Description
SapOkCodeField class is the class for sap OkCodeField.

Inheritance Hierarchy

- *SapComponent*
  - SapOkCodeField

Syntax
```
'Declaration
Public Class SapOkCodeField _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
Opened	whether the GuiOkCodeField is collapsed.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Close	Collapses the GuiOkCodeField.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Open	Expands the GuiOkCodeField.
PressF1	Emulate pressing the F1 key while the focus is on the GuiOkCodeField.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetText	Sets the text of the control to the specified text.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapPicture Class

Description
Class for SAP picture.

Inheritance Hierarchy

- *SapShell*
  - SapPicture

Syntax

```
'Declaration
Public Class SapPicture _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DisplayMode	the display mode of the picture, i.e. "Normal", "Stretch", "Fit", "NormalCenter", "FitCenter"
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
Height	the current height of the component. (Inherited from *SapComponent*)
Icon	the SAPGUI icon code e.g. ("@01@")
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)

Name	Description
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Url	the URL of the picture
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	clicks on a picture
ClickControlArea	clicks on the specified position
ClickPictureArea	clicks on the specified position in the picture area
ContextMenu	The function opens a context menu on the given position. The coordinates should be given in pixels with respect to the picture control as it is displayed on the screen.
DoubleClick	double clicks on the picture
DoubleClickControlArea	double clicks on the specified position
DoubleClickPictureArea	double clicks on the specified position in the picture area

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the

Name	Description
	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapRadioButton Class

Description
SapRadioButton class is the class for radio button controls.

Inheritance Hierarchy

- *SapComponent*
  - SapRadioButton

Syntax
```
'Declaration
Public Class SapRadioButton _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CharHeight	the height of the element in character metric
CharLeft	the left coordinate of the element in character metric
CharTop	the top coordinate of the element in character metric
CharWidth	the width of the element in character metric
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Flushing	whether the value change causes a round trip
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsLeftLabel	whether the component has the 'assign left' flag

Name	Description
IsRightLabel	whether the component has the 'assign right' flag
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Selected	whether the radio button is selected
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Select	Selects the radio button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapScrollbar Class

Description
Class for SAP Scrollbar.

Inheritance Hierarchy

- *TestObject*
  - SapScrollbar
    - *SapHorizontalScrollBar*

- *SapVerticalScrollBar*

Syntax

```
'Declaration
Public Class SapScrollbar _
Inherits TestObject
```

Properties

Name	Description
Maximum	the maximum scrollbar value.
Minimum	the minimum scrollbar value.
PageSize	the scrollbar pagesize.
Position	the current scrollbar position.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
ScrollTo	Scrolls to the given position.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapScrollContainer Class

Description
Class for SAP UserArea.

Inheritance Hierarchy

- *SapComponent*
  - SapScrollContainer

Syntax

```
'Declaration
Public Class SapScrollContainer _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapSplitterContainer Class

Description
Class for SAP splitter container.

Inheritance Hierarchy

- *SapComponent*
  - SapSplitterContainer

Syntax

```
'Declaration
Public Class SapSplitterContainer _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)

Name	Description
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapStatusbar Class

Description
Class for SAP statusbar.

Inheritance Hierarchy

- *SapComponent*
  - SapStatusbar

Syntax

```
'Declaration
Public Class SapStatusbar _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
MessageId	the name of the message class used in the ABAP message call
MessageNumber	the message number used in the ABAP message call
MessageType	the type of the displayed message in the statusbar, i.e. S (Success), W (Warning), E (Error), A (Abort), I (Information)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
DoubleClick	double-clicks the statusbar
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapTable Class

Description
SapTable class is the class for SAP tables.

Inheritance Hierarchy

- *SapComponent*
  - SapTable

Syntax
```
'Declaration
Public Class SapTable _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CharHeight	the height of the element in character metric.
CharLeft	the left coordinate of the element in character metric.
CharTop	the top coordinate of the element in character metric.
CharWidth	the width of the element in character metric.
ColumnCount	the number of columns in the table.
ColumnSelectionMode	the column selection mode
CurrentColumn	the index of the current column.
CurrentRow	the index of the current row.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
RowCount	the number of rows in the table including invisible rows.
RowSelectionMode	the row selection mode.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
TableFieldName	the table field name.
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VisibleRowCount	the number of visible rows in the table.
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ConfigureLayout	Opens the configuration layout dialog, in which the layout of the table can be changed.
DeselectAllColumns	This function can be used for table controls with a button that allows to de-select all columns in one step.
DeselectColumn	Deselects the given column.
DeselectRow	Deselects the given row.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCell	Returns a visible table cell.
GetCellAbsolute	Returns a table cell. If the row is not visible, it will be scrolled into view.
GetCellsForRow	Returns the cells for the given row.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnTitle	This method returns the title of the given column.

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVisibleCellsForColumn	Returns the visible cells for the given column.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsColumnSelected	Returns true if the given column is selected.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsRowSelected	Returns true if the given row is selected.
ReorderTable	This method re-orders the columns.
SelectAllColumns	This function can be used for table controls with a button that allows to select all columns in one step.
SelectColumn	Selects the given column.
SelectRow	Selects the given row.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapTabStrip Class

Description
Class for SAP tab pane.

Inheritance Hierarchy

- *SapComponent*
  - SapTabStrip

Syntax

```
'Declaration
Public Class SapTabStrip _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
SelectedTab	the current selected tab.
Tabs	all tabs of the tab pane.
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)

Name	Description
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapTextEdit Class

Description
Class for SAP TextEdit.

Inheritance Hierarchy

- *SapShell*
  - SapTextEdit

Syntax

```
'Declaration
Public Class SapTextEdit _
Inherits SapShell
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentColumn	the column index in which the caret is currently positioned.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
CurrentLine	the line index in which the caret is currently positioned.

Name	Description
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
FirstVisibleLine	the first visible line which is visualized at the top border of the text edit control.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
LastVisibleLine	the last visible line which is visualized at the bottom border of the text edit control.
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
LineCount	the number of all lines in the text edit control.
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
SelectedText	the currently selected text.
SelectionEndColumn	the column index in which the selection ends.
SelectionEndLine	the line index in which the selection ends.
SelectionIndexEnd	the overall end index of the text selection.
SelectionIndexStart	the overall start index of the text selection.
SelectionStartColumn	the column start index of the text selection.
SelectionStartLine	the line index in which the selection starts.
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ContextMenu	Requests the context menu.
DoubleClick	Double clicks the text edit control.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetLineText	Returns the text of the specified line.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsBreakpointLine	whether the specified line contains a breakpoint.
IsCommentLine	Returns true if the specified line is a comment line.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsHighlightedLine	Returns true if the specified line is highlighted.
IsProtectedLine	Returns true if the specified line is protected.
PressF1	Presses the F1 key.
PressF4	Presses the F4 key.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionIndexes	Selects the text within the specified range.
SetText	Sets the specified text in the text edit control.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapTextField Class

Description
SapTextField is the class for single-line and multi-line fields whose text can be modified by the user.

Inheritance Hierarchy

- *SapComponent*
  - SapTextField

Syntax
```
'Declaration
Public Class SapTextField _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)

Name	Description
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DisplayedText	the text as it is displayed on the screen, including preceding or trailing blanks.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsPassword	whether the text field is a password text field.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetPasswordText	Sends an encrypted password to the object.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetText	Sets the text of the control to the specified text.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapToolbarControl Class

Description
Class for SAP ToolbarControl.

Inheritance Hierarchy

- *SapShell*
  - SapToolbarControl

Syntax

```
'Declaration
Public Class SapToolbarControl _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
ButtonCount	the number of toolbar buttons including separators.
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)
FocusedButton	the zero-based index of the button that currently has the focus.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)

Name	Description
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetButtonIcon	the name of the icon of the specified toolbar button.

Name	Description
GetButtonType	the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox"
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsButtonChecked	if the button is currently checked (pressed).
IsButtonEnabled	if the button can be pressed.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
PressContextButton	Press the context button with the given id.
SelectButton	emulates pressing the button with the given id.
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)

Name	Description
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SelectMenuItem	emulates selecting the menu item with the given id.
SelectMenuItemByText	emulates selecting the menu item by menu item text.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapTree Class

Description
SapTree class is the class for all SAP trees. Some of the methods that have Get as a prefix require the nodeKey and the ItemName as iput parameters of type string. These parameters are different for each individual SapTree element. To obtain the value of these parameters, record an action on the desired item and use the parameters that you have recorded.

Inheritance Hierarchy

- *SapShell*
  - SapTree

Syntax

```
'Declaration
Public Class SapTree _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
ColumnHeaders	a collection of the titles of the columns.
ColumnNames	a collection of the column names.
ColumnOrder	the column order.
ColumnTitles	a collection of the titles of the columns.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from *SapShell*)

Name	Description
FocusedNodeKey	the key of the focused node.
Height	the current height of the component. (Inherited from *SapComponent*)
HierarchyHeaderWidth	the width of the hierarchy header in pixels.
HierarchyTitle	the hierarchy title.
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
NodeKeys	a collection containing either the node key of the root node, or the node keys of all nodes in the tree, depending on the application.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
SelectedItemColumn	the key of the currently selected item column.
SelectedItemNode	the key of the currently selected item node.
SelectedNode	the key of the currently selected node.
SelectedNodes	a collection containing the node keys of all the selected nodes in the tree.
SelectionMode	the selection mode.
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
TopNode	the key of the top node.
TreeType	the tree type. (simple tree, list tree or column tree)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ChangeCheckbox	This method emulates changing a checkbox state.
CollapseNode	This function closes the node with the key nodeKey.
DefaultContextMenu	This method requests a context menu for the whole Tree Control.
DoubleSelectItem	This function emulates double clicking on a text item.
DoubleSelectNode	This function emulates double clicking a node.
EnsureVisibleHorizontalItem	This function scrolls the Tree horizontally until the Item is visible.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExpandNode	This function expands the node with the key nodeKey.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
FindNodeKeyByPath	Return the node key for the given path (e.g. 2\1\2).
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetAbapImage	Gets the abap image.
GetCheckBoxState	Retrieves the CheckBox state (true = Checked, false = Unchecked).
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnIndexFromName	Gets the column index for the given name.
GetColumnKeys	The keys of all the items in the given column.
GetColumnTitleFromName	Gets the column title for the given name.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHierarchyLevel	Gets the hierarchy level for the given key.

Name	Description
GetItemHeight	Returns the current item height.
GetItemLeft	The left position of the component.
GetItemStyle	The style of the given item.
GetItemText	For multi column trees, this function returns the text of the item specified by the key and name parameters.
GetItemTextColor	Returns the item text color.
GetItemTooltip	Returns the item tooltip text.
GetItemTop	The top position of the component.
GetItemType	Returns the type of the given node.
GetItemWidth	Returns the current item width.
GetListTreeNodeItemCount	Returns the node item count.
GetNextNodeKey	Returns the key of the next node.
GetNodeAbapImage	Returns the abap image for the given node.
GetNodeChildrenCount	This function returns the number of children of the node given.
GetNodeChildrenCountByPath	This function returns the number of children of the node given by the path parameter (e.g. 2\1\2).
GetNodeHeight	The current height of the node.
GetNodeIndex	The index of the given node.
GetNodeItemHeaders	Returns the headers for the given node.
GetNodeLeft	The left position of the component.
GetNodePathByKey	Given a node key, the path is retrieved (e.g. 2\1\2).
GetNodeStyle	Returns the style of the node.
GetNodeText	This function returns the text of the node specified by the given key.
GetNodeTextByPath	The text of a node defined by the given path is returned.
GetNodeTextColor	Returns the node text color.
GetNodeTooltip	Returns the node tooltip text.
GetNodeTop	The top position of the component.
GetNodeWidth	Returns the current node width.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetParentNodeKey	Key of the parent node of the node specified by the given key.
GetPreviousNodeKey	Key of the previous node of the node specified by the given key.
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetStyleDescription	Returns the description for the given style.
GetSubNodesKeys	Collection of the keys of all subnodes of the node specified by the given key.
HeaderContextMenu	This method requests a context menu for a header.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsFolder	Whether the given node is a folder.
IsFolderExpandable	Whether the folder is expandable.
IsFolderExpanded	Whether the folder is expanded.
IsHighLighted	Whether the node is highlighted.
ItemContextMenu	This method requests a context menu for an item.
NodeContextMenu	This method requests a context menu for a node.
PressKey	This method emulates pressing a key.
SelectButton	This method emulates pressing a button.
SelectColumn	This function adds a column to the column selection. A node or item selection is removed.
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from *ISapContextMenuable*)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from *ISapContextMenuable*)

Name	Description
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from *ISapContextMenuable*)
SelectHeader	This method emulates clicking a header.
SelectItem	This function emulates the selection of an item. This selection removes all other selections.
SelectLink	This function emulates triggering a link.
SelectNode	The node with the key nodeKey is added to the Node Selection.
SetCheckBoxState	Changes the state of the checkbox in the given node.
SetColumnOrder	Sets the order of the tree's column.
SetColumnWidth	This function sets the width of a column in pixels.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHierarchyHeaderWidth	Sets the width of the Hierarchy Header in pixels.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectedNode	Select the given node.
SetTopNode	Sets the given key as top node.
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
UnselectAll	All selections are removed.
UnselectColumn	This function removes a column from the column selection.
UnselectNode	The node with the key nodeKey is removed from the Node Selection.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapUserArea Class

Description
Class for SAP UserArea.

Inheritance Hierarchy

- *SapComponent*
  - SapUserArea

Syntax

```
'Declaration
Public Class SapUserArea _
Inherits SapComponent _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.

Name	Description
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapVerticalScrollBar Class

Description
Class for vertical scrollbars.

Inheritance Hierarchy

- *SapScrollbar*
  - SapVerticalScrollBar

Syntax
```
'Declaration
Public Class SapVerticalScrollBar _
Inherits SapScrollbar
```

Properties

Name	Description
Maximum	the maximum scrollbar value. (Inherited from *SapScrollbar*)
Minimum	the minimum scrollbar value. (Inherited from *SapScrollbar*)
PageSize	the scrollbar pagesize. (Inherited from *SapScrollbar*)
Position	the current scrollbar position. (Inherited from *SapScrollbar*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
ScrollTo	Scrolls to the given position. (Inherited from *SapScrollbar*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SapWindow Class

Description
SapWindow class is the class for a top-level window.

Inheritance Hierarchy
- *SapComponent*
  - SapWindow

Syntax
```
'Declaration
Public Class SapWindow _
Inherits SapComponent _
Implements IMoveable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from *SapComponent*)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from *SapComponent*)
ButtonbarVisible	whether the application toolbar, the lower toolbar within SAP GUI, is visible.
Changeable	whether an object is changeable. (Inherited from *SapComponent*)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from *SapComponent*)
GuiFocus	the element within SAP GUI that currently has the focus.
Height	the current height of the component. (Inherited from *SapComponent*)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from *SapComponent*)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from *SapComponent*)
Left	the left position of the element in screen coordinates. (Inherited from *SapComponent*)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from *SapComponent*)
Name	the name of the component. (Inherited from *SapComponent*)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from *SapComponent*)
ScreenTop	the top position of the component in screen coordinates. (Inherited from *SapComponent*)
StatusbarVisible	whether the statusbar is visible.
SystemFocus	the element within SAP GUI that has the focus from the server application's perspective.
Text	The text of the control. (Inherited from *TestObject*)
TitlebarVisible	whether the titlebar is visible.
ToolbarVisible	whether the toolbar is visible.
Tooltip	the tooltip text. (Inherited from *SapComponent*)
Top	the top coordinate of the element in screen coordinates. (Inherited from *SapComponent*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	the current width of the component. (Inherited from *SapComponent*)
WindowHandle	the window handle of the control that is connected to the GuiShell.
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)
WorkingPaneHeight	the current height of the working pane.
WorkingPaneWidth	the current width of the working pane.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)

Name	Description
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsVkeyAllowed	The method returns True if the given virtual key can be executed on the current screen.
JumpBackward	Execute the Ctrl+Shift+Tab key on the window to jump backward one block.
JumpForward	Execute the Ctrl+Tab key on the window to jump forward one block.
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
Move	Moves the window. (Inherited from *IMoveable*)
ResizeWorkingPane	The ResizeWorkingPane function will resize the window so that the available working area has the given width and height in character metric.

Name	Description
ResizeWorkingPaneEx	The ResizeWorkingPaneEx function will resize the window so that the available working area has the given width and height in pixels.
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SendVKey	Send a virtual key to the system.
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
ShowContextMenu	Shows the context menu of the control. (Inherited from *SapComponent*)
Size	Resizes the window. (Inherited from *IMoveable*)
TabBackward	Execute the Shift+Tab key on the window to jump backward one element.
TabForward	Execute the Tab key on the window to jump forward one element.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Silverlight Class Reference

Lists the available classes for testing Silverlight controls.

SLApplication Class

Description

The container for Silverlight controls.

Inheritance Hierarchy

- *SLBase*
  - SLApplication

Syntax

```
'Declaration
Public Class SLApplication _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLAutoCompleteBox Class

Description

Represents a control that provides a text box for user input and a drop-down that contains possible matches based on the input in the text box.

Inheritance Hierarchy

- *SLBase*
  - SLAutoCompleteBox

Syntax

```
'Declaration
Public Class SLAutoCompleteBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HorizontallyScrollable	a value that indicates whether the combo box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsOpen	a value that indicates whether the auto complete box is open
Items	a list containing items of the current matches. If nothing was entered in the control's text box an empty list is returned.
ItemTexts	a list containing the texts of the current matches. If nothing was entered in the control's text box an empty list is returned.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the combo box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the drop-down list that contains the matches if it is currently open.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Types the given text into the auto box complete box and selects a match.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the combo box.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLBase Class

Description
Provides a Silverlight framework-level set of properties, events, and methods for Silverlight elements.

Inheritance Hierarchy

- *TestObject*
  - SLBase

Syntax

```
'Declaration
Public Class SLBase _
```

```
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element.
ClassName	the simple class name of the element.
IsEnabled	a value that indicates whether the element is enabled.
Name	a string containing the UI Automation name for the element.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type.
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLButton Class

Description
Identifies a button control.

Inheritance Hierarchy

- *SLBase*
  - SLButton

Syntax
```
'Declaration
Public Class SLButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Clicks the button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLCalendar Class

Description
Identifies a calendar control.

Inheritance Hierarchy

- *SLBase*
  - SLCalendar

Syntax

```
'Declaration
Public Class SLCalendar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
CanSelectMultiple	whether multiple dates can be selected
ClassName	the simple class name of the element. (Inherited from *SLBase*)
DisplayMode	a value that indicates whether the calendar displays a month, year, or decade.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsSelectionRequired	whether at least one date has to be selected
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedDate	the currently selected date in the currently displayed view.
SelectedDates	a list of selected dates in the currently displayed view.

Name	Description
SupportedDisplayModes	a list of supported display modes.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SelectDate	Selects the given date.
SelectDates	Selects the given dates.
SelectRange	Selects a range of dates.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SwitchToDecadeView	Switches the calendar display mode to 'decade', if supported.

Name	Description
SwitchToMonthView	Switches the calendar display mode to 'month', if supported.
SwitchToYearView	Switches the calendar display mode to 'year', if supported.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Clicks the button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLCheckBox Class

Description
Identifies a check box control.

Inheritance Hierarchy

- *SLBase*
  - SLCheckBox

Syntax

```
'Declaration
Public Class SLCheckBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
ToggleState	the toggle state of the check box
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the check box.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetIndeterminate	Set the check box to the indeterminate state.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Toggle	Cycles through the toggle states of the check box in this order: On, Off and, if supported, Indeterminate.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLComboBox Class

Description

Identifies a combo box control.

Combo boxes in Silverlight require to be opened once before information about their items can be retrieved.

Inheritance Hierarchy

- *SLBase*
  - SLComboBox

Syntax

```
'Declaration
Public Class SLComboBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HorizontallyScrollable	a value that indicates whether the combo box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsOpen	a value that indicates whether the combo box is open
Items	a complete list of items.
ItemTexts	a complete list of item texts.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedIndex	the index of the selected item or negative one (-1) if the selection is empty.
SelectedItem	the selected item or `Nothing` if the selection is empty.

Name	Description
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the combo box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the combo box.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Open	Opens the combo box.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.

Name	Description
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects an item in the combo box.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the combo box.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLComboBoxItem Class

Description
Identifies a combo box item control.

Inheritance Hierarchy

- *SLBase*
  - SLComboBoxItem

Syntax

```
'Declaration
Public Class SLComboBoxItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)

If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDataGrid Class

Description

Identifies a data grid control.

If the data grid has a vertical scroll bar, rows which are not in the visible area of the data grid do not expose any information (e.g. text, caption). In order to interact with such a row or retrieve information about the row it needs to be scrolled into view first.

Inheritance Hierarchy

- *SLBase*
  - SLDataGrid

Syntax

```
'Declaration
Public Class SLDataGrid _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)

Name	Description
CanSelectMultiple	whether the data grid allows more than one row to be selected concurrently.
ClassName	the simple class name of the element. (Inherited from *SLBase*)
ColumnCount	the number of columns in the data grid
ColumnHeaders	a list containing the header item for every column
ColumnHeaderTexts	a list containing the text of the header item for every column
HorizontallyScrollable	a value that indicates whether the data grid can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
RowCount	the number of rows in the data grid
Rows	a list of rows in the data grid
RowTexts	a list of row texts in the data grid. The text for every row is returned as a string that contains the text of every cell separated with a blank character.
SelectedCell	the currently selected cell or `Nothing` if no cell is selected
SelectedCellText	the text of the currently selected cell or an empty string if no cell is selected
SelectedRow	the currently selected row or `Nothing` if no row is selected
SelectedRows	a list of currently selected rows or an empty list if no row is selected
SelectedRowText	the text of the currently selected row or an empty string if no row is selected
SelectedRowTexts	the text of the currently selected rows or an empty list if no row is selected
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the data grid can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollIntoView	Scrolls the specified row or cell into view.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects the specified row.
SelectCell	Selects the specified cell.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the data grid.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the data grid.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDataGridCell Class

Description
Identifies a cell within a row of a data grid control.

Inheritance Hierarchy

- *SLBase*
  - SLDataGridCell

Syntax

```
'Declaration
Public Class SLDataGridCell _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsSelected	a value that indicates whether the cell is selected
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scroll the cell into view.
Select	Selects the cell
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the

Name	Description
	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDataGridDetails Class

Description
Identifies a control that displays additional details within a data grid row.

Inheritance Hierarchy

- *SLBase*
  - SLDataGridDetails

Syntax

```
'Declaration
Public Class SLDataGridDetails _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDataGridRow Class

Description
Identifies a row in data grid.

Inheritance Hierarchy

- *SLBase*
  - SLDataGridRow

Syntax

```
'Declaration
Public Class SLDataGridRow _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
Cells	the cells of the data grid row.
CellTexts	the text of the cells of the data grid row.
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsSelected	a value that indicates whether the row is selected.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)

Name	Description
RowHeader	the header for this row
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the row into view.
Select	Selects the row
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDataPager Class

Description
Identifies a data pager for paging through a collection of data.

Inheritance Hierarchy

- *SLBase*

- SLDataPager

Syntax

```
'Declaration
Public Class SLDataPager _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
CurrentPage	The current page.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
PageCount	The count of the pages.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MoveToFirstPage	Moves the data pager to the first page.
MoveToLastPage	Moves the data pager to the last page.

Name	Description
MoveToNextPage	Moves the data pager to the next page.
MoveToPage	Moves the data pager to the given page.
MoveToPreviousPage	Moves the data pager to the previous page.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDatePicker Class

Description

Represents a control that allows the user to select a date.

Inheritance Hierarchy

- *SLBase*
  - SLDatePicker

Syntax

```
'Declaration
Public Class SLDatePicker _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsCalendarOpen	a value whether the drop-down Calendar is open.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedDate	the selected date or `Nothing` if no date is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
CloseCalendar	Closes the drop-down Calendar.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenCalendar	Opens the drop-down Calendar.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLDescriptionViewer Class

Description
Identifies a description viewer control.

Inheritance Hierarchy

- *SLBase*
  - SLDescriptionViewer

Syntax

```
'Declaration
Public Class SLDescriptionViewer _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLFrame Class

Description
Identifies a frame control.

Inheritance Hierarchy

- *SLBase*
  - SLFrame

Syntax
```
'Declaration
Public Class SLFrame _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLGridSplitter Class

Description
Identifies a grid splitter control.

Inheritance Hierarchy

- *SLBase*
  - SLGridSplitter

Syntax

```
'Declaration
Public Class SLGridSplitter _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MoveHorizontal	Moves the splitter horizontally.
MoveVertical	Moves the splitter vertically.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLGroup Class

Description
Identifies a group control, which acts as a container for other controls.

Inheritance Hierarchy

- *SLBase*
  - SLGroup

Syntax

```
'Declaration
Public Class SLGroup _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLHeader Class

Description
Identifies a control that provides a visual container for the labels for rows or columns.

Inheritance Hierarchy

- *SLBase*
  - SLHeader

Syntax
```
'Declaration
Public Class SLHeader _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HeaderItems	a list containing the header items of this header control
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLHeaderItem Class

Description
Identifies a control that provides a visual label for a row or column.

Inheritance Hierarchy

- *SLBase*
  - SLHeaderItem

Syntax

```
'Declaration
Public Class SLHeaderItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects the header item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLHorizontalScrollBar Class

Description
Identifies a horizontal scroll bar.

Inheritance Hierarchy

- *SLBase*
  - SLHorizontalScrollBar

Syntax

```
'Declaration
Public Class SLHorizontalScrollBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Maximum	the maximum scroll position
Minimum	the minimum scroll position
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
ScrollPosition	the current scroll position
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Scrolls the scroll bar by the specified amount
ScrollToMaximum	Scrolls the scroll bar to the right end.
ScrollToMinimum	Scrolls the scroll bar to the left end.
ScrollToPosition	Scrolls the scroll bar to the specific position
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLListBox Class

Description
Identifies a list box control.

Inheritance Hierarchy

- *SLBase*
  - SLListBox

Syntax

```
'Declaration
Public Class SLListBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
CanSelectMultiple	whether the list box allows more than one child element to be selected concurrently.
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HorizontallyScrollable	a value that indicates whether the list box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Items	the list of list box items.
ItemTexts	the list of all item texts.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedIndex	the index of the first item in the current selection or returns negative one (-1) if the selection is empty.
SelectedIndices	the indices of the currently selected items. An empty list is returned if no items are currently selected.
SelectedItem	the first item in the current selection or returns `Nothing` if the selection is empty
SelectedItems	the currently selected items. An empty list is returned, if no items are currently selected.
SelectedItemText	the text of the first selected item.
SelectedItemTexts	the texts of the currently selected items. An empty list is returned if no items are currently selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the list box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DeselectAll	Deselects all list items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects the given list box item.
SelectAll	Selects all items in the list.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the list box.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the list box.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLListItem Class

Description
Identifies a list item control.

Inheritance Hierarchy

- *SLBase*

- SLListItem

Syntax

```
'Declaration
Public Class SLListItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsSelected	a value that indicates whether the list item is selected
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Deselect	Deselects the item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scroll the list item into view.
Select	Selects the list item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLMediaElement Class

Description
Represents a control that contains audio and/or video.

Inheritance Hierarchy

- *SLBase*
  - SLMediaElement

Syntax

```
'Declaration
Public Class SLMediaElement _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLMenuBar Class

Description
Identifies a menu bar control.

Inheritance Hierarchy

- *SLBase*
  - SLMenuBar

Syntax

```
'Declaration
Public Class SLMenuBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLMenuItem Class

Description
Identifies a menu item control.

Inheritance Hierarchy

- *SLBase*
  - SLMenuItem

Syntax
```
'Declaration
Public Class SLMenuItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLMultiScaleImage Class

Description
Enables users to open a multi-resolution image, which can be zoomed in on and panned across.

Inheritance Hierarchy

- *SLBase*
  - SLMultiScaleImage

Syntax

```
'Declaration
Public Class SLMultiScaleImage _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLPane Class

Description
Identifies a pane that can optionally have scroll bars.

Inheritance Hierarchy

- *SLBase*
  - SLPane

Syntax

```
'Declaration
Public Class SLPane _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HorizontallyScrollable	a value that indicates whether the pane can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the pane can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the pane.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the pane.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLPasswordBox Class

Description
Identifies a password box control.

Inheritance Hierarchy

- *SLBase*
  - SLPasswordBox

Syntax

```
'Declaration
Public Class SLPasswordBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsReadOnly	whether the password box is read-only
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all text from the password field.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetPosition	Sets the insertion point in the password field.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelection	Selects a range of text in the password box.
SetText	Replaces the text in the password field with the given text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLPopup Class

Description
Identifies a popup control. Context menus are also treated as popup controls.

Inheritance Hierarchy

- *SLBase*
  - SLPopup

Syntax

```
'Declaration
Public Class SLPopup _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLProgressBar Class

Description
Identifies a progress bar control.

Inheritance Hierarchy

- *SLBase*
  - SLProgressBar

Syntax
```
'Declaration
Public Class SLProgressBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Maximum	the maximum progress value
Minimum	the minimum progress value
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLRadioButton Class

Description
Represents a button that allows a user to select a single option from a group of options.

Inheritance Hierarchy

- *SLBase*
  - SLRadioButton

Syntax
```
'Declaration
Public Class SLRadioButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsSelected	a value that indicates whether the radio button is selected.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLRichTextBox Class

Description
Identifies a rich text box control.

Inheritance Hierarchy

- *SLBase*
  - SLRichTextBox

Syntax
```
'Declaration
Public Class SLRichTextBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedText	the selected text
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Clear	Removes all text from the text box.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetPosition	Sets the insertion point in the text box.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelection	Selects a range of text in the text box.
SetText	Replaces the content in the text box with the given text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a

Name	Description
	timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLSeparator Class

Description
Identifies a separator control.

Inheritance Hierarchy

- *SLBase*
  - SLSeparator

Syntax
```
'Declaration
Public Class SLSeparator _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)

Name	Description
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLSlider Class

Description
Identifies a progress bar control.

Inheritance Hierarchy

- *SLBase*

- SLSlider

Syntax

```
'Declaration
Public Class SLSlider _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
LargeChange	the value that is added to or subtracted from the Value property when a large change is made, such as with the PAGE DOWN key.
Maximum	the maximum progress value
Minimum	the minimum progress value
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SmallChange	the value that is added to or subtracted from the Value property when a small change is made, such as with an arrow key.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DecreaseLarge	Decreases the value of the Slider by a large amount.
DecreaseSmall	Decreases the value of the Slider by a small amount.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
IncreaseLarge	Increases the value of the Slider by a large amount.
IncreaseSmall	Increases the value of the Slider by a small amount.

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetValue	Sets the value of the slider
SetValueToMaximum	Sets the Slider to the maximum position.
SetValueToMinimum	Sets the Slider to the minimum position.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLSpinner Class

Description

Identifies a spinner control.

A spinner control type consists of a set of buttons that enable a user to select from a set of items or set a numerical value from within a range.

Inheritance Hierarchy

- *SLBase*
  - SLSpinner

Syntax

```
'Declaration
Public Class SLSpinner _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)

Name	Description
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
NumericValue	the current numeric value of the spinner
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLSplitButton Class

Description
Identifies a split button control.

Inheritance Hierarchy

- *SLBase*

- SLSplitButton

Syntax

```
'Declaration
Public Class SLSplitButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLStatusBar Class

Description
Identifies a status bar control.

Inheritance Hierarchy

- *SLBase*
  - SLStatusBar

Syntax

```
'Declaration
Public Class SLStatusBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLTabControl Class

Description
Identifies a tab control.

Inheritance Hierarchy

- *SLBase*
  - SLTabControl

Syntax

```
'Declaration
Public Class SLTabControl _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Items	a complete list of tab items.
ItemTexts	a complete list of tab item texts.

Name	Description
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
SelectedIndex	the index of the selected item or negative one (-1) if the selection is empty.
SelectedItem	the selected item or `Nothing` if the selection is empty.
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects an item in the tab control.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLTextBlock Class

Description
Identifies a control for displaying small amounts of flow content.

Inheritance Hierarchy

- *SLBase*
  - SLTextBlock

Syntax

```
'Declaration
Public Class SLTextBlock _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLTextBox Class

Description
Identifies a text box control.

Inheritance Hierarchy

- *SLBase*
  - SLTextBox

Syntax
```
'Declaration
Public Class SLTextBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsReadOnly	whether the text box is read-only
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all text from the text field.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetPosition	Sets the insertion point in the text field.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelection	Selects a range of text in the text box.
SetText	Replaces the text in the text field with the given text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Examples

```
textBox.SetText("some text")
textBox.SetSelection(0, 4) ' selects 4 characters starting from the first one
textBox.TypeKeys("<Ctrl+C>") ' copies the selected text to the clipboard
Dim selectedText = Clipboard.GetText() ' gets the text from the clipboard
```

SLThumb Class

Description
Identifies a thumb control.

Inheritance Hierarchy

- *SLBase*
  - SLThumb

Syntax

```
'Declaration
Public Class SLThumb _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)

Name	Description
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLToggleButton Class

Description
Identifies a toggle button control.

Inheritance Hierarchy

- *SLBase*
  - SLToggleButton

Syntax

```
'Declaration
Public Class SLToggleButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
ToggleState	the toggle state of the button
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Toggle	Cycles through the toggle states of the button in this order: On, Off and, if supported, Indeterminate.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLToolBar Class

Description
Identifies a toolbar control.

Inheritance Hierarchy

- *SLBase*
  - SLToolBar

Syntax

```
'Declaration
Public Class SLToolBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)

Name	Description
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLToolTip Class

Description
Identifies a tooltip control.

Inheritance Hierarchy

- *SLBase*
  - SLToolTip

Syntax

```
'Declaration
Public Class SLToolTip _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLTreeView Class

Description
Represents a control that displays hierarchical data in a tree structure that has items that can expand and collapse.

Inheritance Hierarchy

- *SLBase*
  - SLTreeView

Syntax

```
'Declaration
Public Class SLTreeView _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
HorizontallyScrollable	a value that indicates whether the tree view can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
RootItems	a complete list of all root tree items.
RootItemTexts	a complete list of the texts of all root tree items.
SelectedItem	the selected item or returns `Nothing` if the selection is empty.
SelectedItemPath	the selected item path or an empty item path if nothing is selected
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticallyScrollable	a value that indicates whether the tree view can scroll vertically.

Name	Description
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.
VisibleItemPaths	the visible items in the tree as item paths.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Collapse	Collapses the specified item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands the specified item.
ExpandAll	Expands all items in the tree.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects the specified item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the tree view.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the tree view.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLTreeViewItem Class

Description
Represents a selectable item in a tree control.

Inheritance Hierarchy

- *SLBase*
  - SLTreeViewItem

Syntax
```
'Declaration
Public Class SLTreeViewItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
IsExpanded	a value that indicates whether the nested items in a tree item are expanded or collapsed.
IsLeaf	a value that indicates whether the tree view item is a leaf item.
IsSelected	a value that indicates whether a tree item is selected.
Items	a complete list of items.
ItemTexts	a complete list of item texts.
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Collapse	Collapses the item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands the item.
ExpandSubTree	Expands the sub tree under this tree item.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the tree item into view
Select	Selects the item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLValidationSummary Class

Description
Identifies a validation summary control.

Inheritance Hierarchy

- *SLBase*
  - SLValidationSummary

Syntax

```
'Declaration
Public Class SLValidationSummary _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLVerticalScrollBar Class

Description
Identifies a vertical scroll bar.

Inheritance Hierarchy

- *SLBase*
  - SLVerticalScrollBar

Syntax
```
'Declaration
Public Class SLVerticalScrollBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Maximum	the maximum scroll position
Minimum	the minimum scroll position
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)
ScrollPosition	the current scroll position
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Scroll	Scrolls the scroll bar by the specified amount
ScrollToMaximum	Scrolls the scroll bar to the bottom.
ScrollToMinimum	Scrolls the scroll bar to the top.
ScrollToPosition	Scrolls the scroll bar to the specific position
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SLWindow Class

Description
Identifies a window control.

Inheritance Hierarchy

- *SLBase*
  - SLWindow

Syntax

```
'Declaration
Public Class SLWindow _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from *SLBase*)
ClassName	the simple class name of the element. (Inherited from *SLBase*)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from *SLBase*)
Name	a string containing the UI Automation name for the element. (Inherited from *SLBase*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from *SLBase*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Java AWT and Swing Class Reference

Lists the available classes for testing Java AWT and Swing controls.

AbstractButton Class

Description
Defines common behaviors for buttons and menu items.

Inheritance Hierarchy

- *JComponent*
  - AbstractButton
    - *JButton*
    - *JMenuItem*
    - *JToggleButton*

Syntax

```
'Declaration
Public Class AbstractButton _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Applet Class

Description
Represents the Java Applet in the browser.

Inheritance Hierarchy
- *AWTContainer*
  - Applet

Syntax
```
'Declaration
Public Class Applet _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AppletContainer Class

Description
Root element of an Applet in the browser.

Inheritance Hierarchy

- *AWTContainer*
  - AppletContainer

Syntax

```
'Declaration
Public Class AppletContainer _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)

Name	Description
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTButton Class

Description
Represents a push button.

Inheritance Hierarchy

PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Toggle	Toggles the check box state.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTCheckboxMenuItem Class

Description
Represents a check box control that can be inserted in a menu item.

Inheritance Hierarchy

- *AWTMenuItem*
  - AWTCheckboxMenuItem

Syntax
```
'Declaration
Public Class AWTCheckboxMenuItem _
Inherits AWTMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTMenuItem*)
Checked	whether the check box of the menu item is checked.
Enabled	Whether the menu item is enabled. (Inherited from *AWTMenuItem*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the check box of the menu item.
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects the menu item. (Inherited from *AWTMenuItem*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Toggle	Toggles the check box state of the menu item.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box of the menu item.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTChoice Class

Description
Represents a combo box.

Inheritance Hierarchy

- *AWTComponent*
  - AWTChoice

Syntax

```
'Declaration
Public Class AWTChoice _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
ItemCount	the number of items in the combo box.
Items	the list of combo box items.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected.
SelectedItem	the selected item. NULL is returned, if no item is currently selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the specified item in the combo box.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

AWTComponent Class

Description
AWTComponent is the base class for Java AWT.

Inheritance Hierarchy

- *TestObject*
  - AWTComponent
    - *AWTButton*
    - *AWTCanvas*
    - *AWTCheckbox*
    - *AWTChoice*
    - *AWTContainer*
    - *AWTLabel*
    - *AWTList*
    - *AWTRadioButton*
    - *AWTScrollbar*
    - *AWTTextComponent*

Syntax
```
'Declaration
Public Class AWTComponent _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable, INativeWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component.
AccessibleRole	The accessible role of the component.
Background	The background color of the component.
Cursor	The name of the cursor set in the component.
Enabled	whether the component is enabled.

Name	Description
Focusable	whether the component can be focused.
Font	The font of the component.
Foreground	The foreground color of the component.
Height	The current height of the component.
Name	The name of the component.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane.

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTDialog Class

Description
Represents a dialog box.

Inheritance Hierarchy

- *AWTWindow*
  - AWTDialog

- *JDialog*

Syntax

```
'Declaration
Public Class AWTDialog _
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Modal	whether the dialog is modal.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Resizable	whether the dialog is resizable by the user.
Text	The text of the control. (Inherited from *TestObject*)
Title	the title of the dialog.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTFrame Class

Description
Represents a top-level window with a title and a border.

Inheritance Hierarchy

- *AWTWindow*
  - AWTFrame
    - *JFrame*

Syntax

```
'Declaration
Public Class AWTFrame _
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Resizable	whether the frame is resizable by the user.
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Title	the title of the frame.
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTHorizontalScrollbar Class

Description
Represents a horizontal scroll bar.

Inheritance Hierarchy
- *AWTScrollbar*
  - AWTHorizontalScrollbar

Syntax
```
'Declaration
Public Class AWTHorizontalScrollbar _
Inherits AWTScrollbar
```

Properties
Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)

Name	Description
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTList Class

Description
Represents a list box.

Inheritance Hierarchy

- *AWTComponent*
  - AWTList

Syntax

```
'Declaration
Public Class AWTList _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
ItemCount	the number of list items.
Items	a list of items in the list.
MultipleMode	whether the list allows multiple selection.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	the index of the currently selected item. -1 (4Test: 0) is returned, if no item is currently selected.
SelectedIndices	the indices of the currently selected items. An empty list is returned, if no items are currently selected.

Name	Description
SelectedItem	the currently selected list item. NULL is returned, if no item is currently selected.
SelectedItems	the currently selected list items. An empty list is returned, if no items are currently selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Deselect	Deselects the specified list item.
DeselectAll	Deselects all list items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleClickItem	Double-clicks a list item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItem	Returns the list item at the specified index.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the specified item.
SelectAll	Selects all items in the list.
SelectRange	Selects all items within the specified range.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the

Name	Description
	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTMenu Class

Description
Represents a menu component that is accessed from a menu bar.

Inheritance Hierarchy

- *AWTMenuItem*
  - AWTMenu

Syntax
```
'Declaration
Public Class AWTMenu _
Inherits AWTMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTMenuItem*)
Enabled	Whether the menu item is enabled. (Inherited from *AWTMenuItem*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects the menu item. (Inherited from *AWTMenuItem*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTMenuComponent Class

Description
Represents the base class of all menu-related controls.

Inheritance Hierarchy

- *TestObject*
  - AWTMenuComponent
    - *AWTMenuItem*

Syntax
```
'Declaration
Public Class AWTMenuComponent _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable
```

Properties

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTMenuItem Class

Description
Represents a menu item.

Inheritance Hierarchy

- *AWTMenuComponent*
  - AWTMenuItem
    - *AWTCheckboxMenuItem*
    - *AWTMenu*

Syntax
```
'Declaration
Public Class AWTMenuItem _
Inherits AWTMenuComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component.
Enabled	Whether the menu item is enabled.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects the menu item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTRadioButton Class

Description
Represents a radio button.

Inheritance Hierarchy

- *AWTComponent*
  - AWTRadioButton

Syntax

```
'Declaration
Public Class AWTRadioButton _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Name	Description
Background	The background color of the component. (Inherited from *AWTComponent*)
Checked	Whether the radio button is checked.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks the radio button.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTScrollbar Class

Description

Represents a scroll bar. This class includes scroll bars that are parts of controls, such as the scroll bar on a list box.

Inheritance Hierarchy

- *AWTComponent*
  - AWTScrollbar
    - *AWTHorizontalScrollbar*
    - *AWTVerticalScrollbar*

Syntax

```
'Declaration
Public Class AWTScrollbar _
Inherits AWTComponent _
Implements IAWTScroller
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)

Name	Description
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
Page	Increments the current scroll position by specified number of pages. (Inherited from *IAWTScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IAWTScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTScrollPane Class

Description
Represents a class that implements automatic horizontal or vertical scrolling for a single child component.

Inheritance Hierarchy

- *AWTContainer*
  - AWTScrollPane

Syntax

```
'Declaration
Public Class AWTScrollPane _
Inherits AWTContainer _
Implements IAWTScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)

Name	Description
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	the current scroll position of the scrollable component. (Inherited from *IAWTScrollable*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Gets the horizontal scroll bar. (Inherited from *IAWTScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Gets the vertical scroll bar. (Inherited from *IAWTScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScrollable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. Name	Description
	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTTextArea Class

Description
Represents a text area.

Inheritance Hierarchy

- *AWTTextComponent*
  - AWTTextArea

Syntax

```
'Declaration
Public Class AWTTextArea _
Inherits AWTTextComponent _
Implements IAWTScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *AWTTextComponent*)
Columns	the number of columns in the text area.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user. (Inherited from *AWTTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)

Name	Description
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	the current scroll position of the scrollable component. (Inherited from *IAWTScrollable*)
Rows	The number of rows in the text area.
SelectedText	the current selected text. (Inherited from *AWTTextComponent*)
SelectionEnd	the end position of the selected text. (Inherited from *AWTTextComponent*)
SelectionStart	the start position of the selected text. (Inherited from *AWTTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from the text component. (Inherited from *AWTTextComponent*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Gets the horizontal scroll bar. (Inherited from *IAWTScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Gets the vertical scroll bar. (Inherited from *IAWTScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Insert	Inserts the specified text at the specified position.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReplaceRange	Replaces text between the specified start and end positions with the specified replacement text.
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScrollable*)
SelectAll	Selects all the text in the text component. (Inherited from *AWTTextComponent*)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *AWTTextComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *AWTTextComponent*)
SetText	Sets the text of the text component to the specified text. (Inherited from *AWTTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An

Name	Description
	exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTTextComponent Class

Description
Represents the base class for the AWTTextField and AWTTextArea classes.

Inheritance Hierarchy

- *AWTComponent*
  - AWTTextComponent
    - *AWTTextArea*
    - *AWTTextField*

Syntax

```
'Declaration
Public Class AWTTextComponent _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedText	the current selected text.
SelectionEnd	the end position of the selected text.
SelectionStart	the start position of the selected text.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from the text component.
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the text in the text component.
SetCaretPosition	Sets the position of the text insertion caret for this text component.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range.
SetText	Sets the text of the text component to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by

Name	Description
	the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTTextField Class

Description
Represents single-line and multi-line text field controls whose text can be modified by the user.

Inheritance Hierarchy

- *AWTTextComponent*
  - AWTTextField

Syntax
```
'Declaration
Public Class AWTTextField _
Inherits AWTTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Name	Description
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *AWTTextComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
EchoChar	the character that is displayed instead of the characters that are actually typed.
EchoCharSet	whether *EchoChar* is set to a value other than *0*.
Editable	whether the text of the text component can be changed by the user. (Inherited from *AWTTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
IsPassword	whether the text field is a password text field.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedText	the current selected text. (Inherited from *AWTTextComponent*)
SelectionEnd	the end position of the selected text. (Inherited from *AWTTextComponent*)
SelectionStart	the start position of the selected text. (Inherited from *AWTTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from the text component. (Inherited from *AWTTextComponent*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the text in the text component. (Inherited from *AWTTextComponent*)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *AWTTextComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *AWTTextComponent*)
SetText	Sets the text of the text component to the specified text. (Inherited from *AWTTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTVerticalScrollbar Class

Description
Represents a vertical scroll bar.

Inheritance Hierarchy

- *AWTScrollbar*
  - AWTVerticalScrollbar

Syntax

```
'Declaration
Public Class AWTVerticalScrollbar _
Inherits AWTScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

AWTWindow Class

Description
Represents a top-level window with no borders and no menubar.

Inheritance Hierarchy

- *AWTContainer*
  - AWTWindow
    - *AWTDialog*
    - *AWTFrame*
    - *JWindow*

Syntax

```
'Declaration
Public Class AWTWindow _
```

```
Inherits AWTContainer _
Implements IMoveable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

BasicArrowButton Class

Description
Represents a push button with an arrow in one of the cardinal directions.

Inheritance Hierarchy

- *JButton*

- BasicArrowButton

Syntax

```
'Declaration
Public Class BasicArrowButton _
Inherits JButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Direction	the direction the arrow points to.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button. (Inherited from *AbstractButton*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by

Name	Description
	the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

IAWTScrollable Interface

Description
Represents an interface for AWT objects that can have two scroll bars.

Inheritance Hierarchy

- *IBaseScrollable*
  - IAWTScrollable

Syntax

```
'Declaration
Public Class IAWTScrollable _
Inherits IBaseScrollable
```

Properties

Name	Description
Position	the current scroll position of the scrollable component. (Inherited from *IBaseScrollable*)

Methods

Name	Description
GetHorizontalBar	Gets the horizontal scroll bar.
GetVerticalBar	Gets the vertical scroll bar.
ScrollTo	Scrolls to the specified position. (Inherited from *IBaseScrollable*)

IAWTScroller Interface

Description
Represents an interface for scrollable AWT objects.

Syntax
```
'Declaration
Public Class IAWTScroller
```

Properties

Name	Description
PageSize	the block increment value of the scroll bar.
Position	the current position of the scroll bar.
Range	the range value of the scroll bar.
StepSize	the unit increment value of the scroll bar.

Methods

Name	Description
Page	Increments the current scroll position by specified number of pages.
ScrollTo	Scrolls to the specified position.
Step	Increments the current scroll position by specified steps.

IBaseScrollable Interface

Description
Represents an interface for other scrollable controls to avoid duplication.

Syntax
```
'Declaration
Public Class IBaseScrollable
```

Properties

Name	Description
Position	the current scroll position of the scrollable component.

Methods

Name	Description
ScrollTo	Scrolls to the specified position.

IOracleFormsMenuBase Interface

Description
Represents a control that defines choices for users to select.

Syntax
```
'Declaration
Public Class IOracleFormsMenuBase
```

Properties

Name	Description
Checked	Whether the MenuItem is checked.

IOracleFormsScrollable Interface

Description
Represents an interface for scrollable oracle forms objects.

Syntax
```
'Declaration
Public Class IOracleFormsScrollable
```

Properties

Name	Description
HorizontalScrollbarPageSize	the block increment value of the scroll bar.
HorizontalScrollbarPosition	the current position of the scroll bar.
HorizontalScrollbarRange	the range value of the scroll bar.
HorizontalScrollbarStepSize	the unit increment value of the scroll bar.
VerticalScrollbarPageSize	the block increment value of the scroll bar.
VerticalScrollbarPosition	the current position of the scroll bar.
VerticalScrollbarRange	the range value of the scroll bar.
VerticalScrollbarStepSize	the unit increment value of the scroll bar.

Methods

Name	Description
GetHorizontalScrollbar	Gets the horizontal scroll bar.
GetVerticalScrollbar	Gets the vertical scroll bar.

Name	Description
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages.
HorizontalScrollbarScrollTo	Scrolls to the specified position.
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller.
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller.
HorizontalScrollbarStep	Increments the current scroll position by specified steps.
VerticalScrollbarPage	Increments the current scroll position by specified number of pages.
VerticalScrollbarScrollTo	Scrolls to the specified position.
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller.
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller.
VerticalScrollbarStep	Increments the current scroll position by specified steps.

IOracleFormsScroller Interface

Description
Represents an interface for scrollable oracle forms objects.

Inheritance Hierarchy

- *IAWTScroller*
  - IOracleFormsScroller

Syntax
```
'Declaration
Public Class IOracleFormsScroller _
Inherits IAWTScroller
```

Properties

Name	Description
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)

Methods

Name	Description
Page	Increments the current scroll position by specified number of pages. (Inherited from *IAWTScroller*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScroller*)

Name	Description
ScrollToMax	Scrolls to the maximum position of the scroller.
ScrollToMin	Scrolls to the minimum position of the scroller.
Step	Increments the current scroll position by specified steps. (Inherited from *IAWTScroller*)

JButton Class

Description
Represents a push button.

Inheritance Hierarchy

- *AbstractButton*
  - JButton
    - *BasicArrowButton*

Syntax

```
'Declaration
Public Class JButton _
Inherits AbstractButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button. (Inherited from *AbstractButton*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JCheckBox Class

Description
Represents a check box.

Inheritance Hierarchy

- *JToggleButton*
  - JCheckBox

Syntax

```
'Declaration
Public Class JCheckBox _
Inherits JToggleButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Selected	whether the toggle button is selected. (Inherited from *JToggleButton*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JCheckBoxMenuItem Class

Description
Represents a check box control that can be included in a menu item.

Inheritance Hierarchy

- *JMenuItem*
  - JCheckBoxMenuItem

Syntax

```
'Declaration
Public Class JCheckBoxMenuItem _
Inherits JMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Checked	whether the check box in a menu item is checked.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button. (Inherited from *AbstractButton*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JColorChooser Class

Description
Represents a color chooser.

Inheritance Hierarchy

- *JComponent*
  - JColorChooser

Syntax

```
'Declaration
Public Class JColorChooser _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Color	the current color value from the color chooser.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetColor	Sets the current color of the color chooser to the specified color.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. 	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JComboBox Class

Description
Represents a combo box.

Inheritance Hierarchy

- *JComponent*
  - JComboBox

Syntax

```
'Declaration
Public Class JComboBox _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the combo box is editable.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
ItemCount	the number of items in the list.
Items	the list of all contained items.
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	the index of the currently selected item.
SelectedItem	the current selected item.
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JDialog Class

Description
Represents a dialog box.

Inheritance Hierarchy

- *AWTDialog*
  - JDialog

Syntax

```
'Declaration
Public Class JDialog _
Inherits AWTDialog
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Modal	whether the dialog is modal. (Inherited from *AWTDialog*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Resizable	whether the dialog is resizable by the user. (Inherited from *AWTDialog*)
Text	The text of the control. (Inherited from *TestObject*)
Title	the title of the dialog. (Inherited from *AWTDialog*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JEditorPane Class

Description
Represents a text component where you can edit different types of content.

Inheritance Hierarchy

- *JTextComponent*
  - JEditorPane
    - *JTextPane*

Syntax

```
'Declaration
Public Class JEditorPane _
Inherits JTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *JTextComponent*)
ContentType	the type of content that this editor is currently set to deal with.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user. (Inherited from *JTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
FormattedText	the text of the editor pane.

Name	Description
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Page	the current URL being displayed.
SelectedText	the current selected text. (Inherited from *JTextComponent*)
SelectionEnd	the end position of the selection. (Inherited from *JTextComponent*)
SelectionStart	the start position of the selection. (Inherited from *JTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from text component. (Inherited from *JTextComponent*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the content in the text component. (Inherited from *JTextComponent*)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *JTextComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *JTextComponent*)
SetText	Sets the text content to the specified text. (Inherited from *JTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JFrame Class

Description
Represents a class for an extended version of AWTFrame that adds support for Java Swing.

Inheritance Hierarchy

- *AWTFrame*
  - JFrame

Syntax

```
'Declaration
Public Class JFrame _
Inherits AWTFrame
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)

Name	Description
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Resizable	whether the frame is resizable by the user. (Inherited from *AWTFrame*)
Text	The text of the control. (Inherited from *TestObject*)
Title	the title of the frame. (Inherited from *AWTFrame*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)

Name	Description
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JHorizontalScrollBar Class

Description
Represents a horizontal scroll bar.

Inheritance Hierarchy

- *JScrollBar*
  - JHorizontalScrollBar

Syntax
```
'Declaration
Public Class JHorizontalScrollBar _
Inherits JScrollBar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
Page	Increments the current scroll position by specified number of pages. (Inherited from *IAWTScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IAWTScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by

Name	Description
	the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JLabel Class

Description
Represents a display area for displaying a short text, image, or both.

Inheritance Hierarchy

- *JComponent*
  - JLabel

Syntax
```
'Declaration
Public Class JLabel _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Name	Description
Alignment	the alignment of the label.
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button. (Inherited from *AbstractButton*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JMenuBar Class

Description
Represents a menu bar.

Inheritance Hierarchy

- *JComponent*
  - JMenuBar

Syntax

```
'Declaration
Public Class JMenuBar _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JPasswordField Class

Description
Represents a single-line field that does not show the original characters.

Inheritance Hierarchy

- *JTextField*
  - JPasswordField

Syntax

```
'Declaration
Public Class JPasswordField _
Inherits JTextField
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Alignment	the alignment of the text field. (Inherited from *JTextField*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *JTextComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
EchoChar	the character that is displayed instead of the characters that are actually typed.
EchoCharSet	whether *EchoChar* is set to a value other than *0*.
Editable	whether the text of the text component can be changed by the user. (Inherited from *JTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedText	the current selected text. (Inherited from *JTextComponent*)
SelectionEnd	the end position of the selection. (Inherited from *JTextComponent*)
SelectionStart	the start position of the selection. (Inherited from *JTextComponent*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the content in the text component. (Inherited from *JTextComponent*)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *JTextComponent*)

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *JTextComponent*)
SetText	Sets the text content to the specified text. (Inherited from *JTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JPopupMenu Class

Description
Represents a context menu.

Inheritance Hierarchy

- *JComponent*
  - JPopupMenu

Syntax

```
'Declaration
Public Class JPopupMenu _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JRootPane Class

Description
Represents a root pane.

Inheritance Hierarchy

- *JComponent*
  - JRootPane

Syntax

```
'Declaration
Public Class JRootPane _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JScrollBar Class

Description
Represents a scroll bar.

Inheritance Hierarchy

- *JComponent*
  - JScrollBar
    - *JHorizontalScrollBar*
    - *JVerticalScrollBar*

Syntax

```
'Declaration
Public Class JScrollBar _
```

```
Inherits JComponent _
Implements IAWTScroller
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

JSlider Class

Description
Represents a slider control which can select a value within a range.

Inheritance Hierarchy

- *JComponent*
  - JSlider

Syntax

```
'Declaration
Public Class JSlider _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Name	Description
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Inverted	the value is *true* if the value-range shown for the slider is reversed.
Maximum	the maximum value supported by the slider.
Minimum	the minimum value supported by the slider.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	the position of the slider.
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JSpinner Class

Description
Represents a spinner control which can iterate a sequence of values.

Inheritance Hierarchy

- *JComponent*
  - JSpinner

Syntax

```
'Declaration
Public Class JSpinner _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)

Name	Description
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Next	Sets the spinner to the object in the sequence that comes after the object returned by the Value property.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Previous	Sets the spinner to the object in the sequence that comes before the object returned by the Value property.

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the

Name	Description
	timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JSplitPane Class

Description
Represents a split pane control which divides two components horizontally or vertically.

Inheritance Hierarchy

- *JComponent*
  - JSplitPane

Syntax
```
'Declaration
Public Class JSplitPane _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
DividerLocation	the current divider location.
DividerSize	the size of the divider.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
MaximumDividerLocation	the maximum location of the divider.
MinimumDividerLocation	the minimum location of the divider.
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTable Class

Description
Represents a table control which has rows and columns.

Inheritance Hierarchy

- *JComponent*
  - JTable

Syntax
```
'Declaration
Public Class JTable _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
AllCellTexts	the text values of all cells in the table. The cells are grouped in rows, where each row contains the texts of its cells.
AllCellValues	the values of all cells in the table. The cells are grouped in rows, where each row contains the values of its cells.
Background	The background color of the component. (Inherited from *AWTComponent*)
ColumnCount	the number of columns in the table.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
EditingColumn	the name or index of the column that contains the cell currently being edited.
EditingRow	the index of the row that contains the cell currently being edited.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
RowCount	the number of rows that can be shown in the table.
SelectedColumn	the index or name of the selected column. -1 (4Test: 0) is returned if no column is selected.
SelectedColumns	the list of indices of all selected columns.
SelectedRow	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
SelectedRows	the list of indices of all selected rows.
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearSelection	Deselects all selected columns and rows.
Click	Clicks on the object. (Inherited from *IClickable*)
ClickCell	Clicks the specified cell in the table.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleClickCell	Double-clicks the specified cell in the table.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
FindCell	Returns the cell containing the specified text.
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCellText	Returns the cell text.
GetCellValue	Returns the cell value.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnName	Returns the name of the column at the specified index.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsCellEditable	Returns true if the specified cell is editable.
IsCellSelected	Returns true if the specified cell is selected; otherwise false.
IsColumnSelected	Returns true if the specified column is selected.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
IsRowSelected	Returns true if the specified row is selected.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MoveColumn	Moves the column to the position of the target column.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ResizeColumn	Resizes the specified column.
ScrollCellIntoView	Scrolls the specified cell into view.
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all rows, columns, and cells in the table.
SelectColumn	Selects the specified column.
SelectRow	Selects the specified row.
SetCellValue	Sets the specified value for the specified cell in the table.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTableHeader Class

Description
Represents table header class for the table component.

Inheritance Hierarchy

- *JComponent*
  - JTableHeader

Syntax
```
'Declaration
Public Class JTableHeader _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
ClickColumnHeader	Clicks the column header of the table.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTextArea Class

Description
Represents a multiple-line area control that displays plain text.

Inheritance Hierarchy

- *JTextComponent*
  - JTextArea

Syntax

```
'Declaration
Public Class JTextArea _
Inherits JTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *JTextComponent*)
Columns	the number of columns in the text area.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user. (Inherited from *JTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Rows	The number of rows in the text area.
SelectedText	the current selected text. (Inherited from *JTextComponent*)
SelectionEnd	the end position of the selection. (Inherited from *JTextComponent*)
SelectionStart	the start position of the selection. (Inherited from *JTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from text component. (Inherited from *JTextComponent*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)

An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTextField Class

Description

Represents a single-line text field control whose text can be modified by the user.

Inheritance Hierarchy

- *JTextComponent*
  - JTextField
    - *JPasswordField*

Syntax

```
'Declaration
Public Class JTextField _
Inherits JTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Alignment	the alignment of the text field.
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *JTextComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user. (Inherited from *JTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedText	the current selected text. (Inherited from *JTextComponent*)
SelectionEnd	the end position of the selection. (Inherited from *JTextComponent*)
SelectionStart	the start position of the selection. (Inherited from *JTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the content in the text component. (Inherited from *JTextComponent*)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *JTextComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *JTextComponent*)
SetText	Sets the text content to the specified text. (Inherited from *JTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTextPane Class

Description
Represents a text pane control that can be marked with attributes that are represented graphically.

Inheritance Hierarchy

- *JEditorPane*
  - JTextPane

Syntax

```
'Declaration
Public Class JTextPane _
Inherits JEditorPane
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from *JTextComponent*)
CharacterAttributes	the character attributes in effect at the location of the caret.
ContentType	the type of content that this editor is currently set to deal with. (Inherited from *JEditorPane*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text component can be changed by the user. (Inherited from *JTextComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
FormattedText	the text of the editor pane. (Inherited from *JEditorPane*)
Height	The current height of the component. (Inherited from *AWTComponent*)
LogicalStyle	the logical style assigned to the current paragraph in effect at the location of the caret.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Page	the current URL being displayed. (Inherited from *JEditorPane*)
ParagraphAttributes	the attributes of the current paragraph in effect at the location of the caret.
SelectedText	the current selected text. (Inherited from *JTextComponent*)
SelectionEnd	the end position of the selection. (Inherited from *JTextComponent*)

Name	Description
SelectionStart	the start position of the selection. (Inherited from *JTextComponent*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from text component. (Inherited from *JTextComponent*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SelectAll	Selects all the content in the text component. (Inherited from *JTextComponent*)

Name	Description
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from *JTextComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range. (Inherited from *JTextComponent*)
SetText	Sets the text content to the specified text. (Inherited from *JTextComponent*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JToggleButton Class

Description
Represents a two-state button.

Inheritance Hierarchy

- *AbstractButton*
  - JToggleButton
    - *JCheckBox*
    - *JRadioButton*

Syntax

```
'Declaration
Public Class JToggleButton _
Inherits AbstractButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Selected	whether the toggle button is selected.
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JTree Class

Description
Represents a tree.

Inheritance Hierarchy

- *JComponent*
  - JTree

Syntax
```
'Declaration
Public Class JTree _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
IsEditable	whether the tree is editable.
IsEditing	whether the tree is being edited.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedItemPath	the selected item path.
SelectedItemPaths	the list of selected item paths.
SelectedItemText	the selected item text.
SelectionCount	the number of tree nodes selected.
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VisibleItemPaths	the visible items in the tree as item paths.
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CancelEditing	Cancels the current editing session.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearSelection	Clears the selection.
Click	Clicks on the object. (Inherited from *IClickable*)
ClickNode	Clicks on a tree node specified by the item path.
Collapse	Collapses the tree node identified by the specified item path.
CollapseAll	Collapses all tree nodes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleClickNode	Double-clicks on a tree node specified by the item path.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands the tree node identified by the specified item path.
ExpandAll	Expands all tree nodes.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetItemRect	Returns the size and position of the item relative to the tree.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsExpanded	Returns 'true' if the specified item path is expanded.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsPathEditable	whether an item path is editable.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollPathIntoView	Scrolls the given item path to a visible position.
Select	Selects a tree node identified by the specified item path.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
StartEditing	Starts editing at given item path or current selection.
StopEditing	Stops the current editing session.

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JVerticalScrollBar Class

Description
Represents a vertical scroll bar.

Inheritance Hierarchy

- *JScrollBar*
  - JVerticalScrollBar

Syntax

```
'Declaration
Public Class JVerticalScrollBar _
Inherits JScrollBar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IAWTScroller*)
Position	the current position of the scroll bar. (Inherited from *IAWTScroller*)
Range	the range value of the scroll bar. (Inherited from *IAWTScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IAWTScroller*)
Text	The text of the control. (Inherited from *TestObject*)
ToolTipText	the tool tip text of a Swing component. (Inherited from *JComponent*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
Page	Increments the current scroll position by specified number of pages. (Inherited from *IAWTScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IAWTScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IAWTScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

JViewport Class

Description
Represents the Swing viewport.

Inheritance Hierarchy

- *JComponent*

- JViewport

Syntax

```
'Declaration
Public Class JViewport _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

JWindow Class

Description
Represents a container that can be displayed anywhere on the user's desktop.

Inheritance Hierarchy

- *AWTWindow*
  - JWindow

Syntax
```
'Declaration
Public Class JWindow _
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Name	Description
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsApplication Class

Description
Represents an Oracle Forms application.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsApplication

Syntax

```
'Declaration
Public Class OracleFormsApplication _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SplashScreenRunning	whether the application currently displays a splash screen.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsButton Class

Description
Represents a push button.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsButton

Syntax

```
'Declaration
Public Class OracleFormsButton _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Default	Whether the button is the default button.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the specified item in the choice. (Inherited from *OracleFormsChoice*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetText	Sets the text of the combo box to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsContainer Class

Description
Represents a component that can contain other Oracle Forms components.

Inheritance Hierarchy

- *AWTContainer*
  - OracleFormsContainer
    - *OracleFormsApplication*
    - *OracleFormsButton*
    - *OracleFormsCheckbox*
    - *OracleFormsChoice*
    - *OracleFormsLabel*
    - *OracleFormsListView*
    - *OracleFormsMenu*
    - *OracleFormsMenuItem*

- *OracleFormsRadioButton*
- *OracleFormsScrollbar*
- *OracleFormsStatusArea*
- *OracleFormsStatusBar*
- *OracleFormsStatusBarItem*
- *OracleFormsStatusIndicator*
- *OracleFormsTabBar*
- *OracleFormsTabBarItem*
- *OracleFormsTabPanel*
- *OracleFormsTextField*
- *OracleFormsTitleBar*
- *OracleFormsToolBar*
- *OracleFormsToolBarItem*
- *OracleFormsTree*

Syntax

```
'Declaration
Public Class OracleFormsContainer _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsHorizontalScrollbar Class

Description
Represents a horizontal scroll bar.

Inheritance Hierarchy

- *OracleFormsScrollbar*
  - OracleFormsHorizontalScrollbar

Syntax

```
'Declaration
Public Class OracleFormsHorizontalScrollbar _
Inherits OracleFormsScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Position	the current position of the scroll bar. (Inherited from *IOracleFormsScroller*)
Range	the range value of the scroll bar. (Inherited from *IOracleFormsScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
Page	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScroller*)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScroller*)
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsLabel Class

Description
Represents a class for placing text in a container.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsLabel

Syntax

```
'Declaration
Public Class OracleFormsLabel _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsListBox Class

Description
Represents a ListBox.

Inheritance Hierarchy

- *OracleFormsChoice*
  - OracleFormsListBox

Syntax

```
'Declaration
Public Class OracleFormsListBox _
Inherits OracleFormsChoice _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
ItemCount	the number of items in the choice. (Inherited from *OracleFormsChoice*)
Items	the list of choice items. (Inherited from *OracleFormsChoice*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from *OracleFormsChoice*)
SelectedItem	the selected item. (Inherited from *OracleFormsChoice*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
ClickItem	Clicks the specified list item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleClickItem	Double-clicks a list item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from *IOracleFormsScrollable*)
GetItemText	Returns the item at the specified index. (Inherited from *OracleFormsChoice*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from *IOracleFormsScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the specified item in the choice. (Inherited from *OracleFormsChoice*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsListView Class

Description
Represents a listview.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsListView

Syntax

```
'Declaration
Public Class OracleFormsListView _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
AllCellTexts	the text values of all cells in the listview. The cells are grouped in rows, where each row contains the texts of its cells.
Background	The background color of the component. (Inherited from *AWTComponent*)
ColumnCount	the number of columns in the listview.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)

Name	Description
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
FocusedRow	the index of the focused row, -1 (4Test: 0) is returned if no row is focused.
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
RowCount	the number of rows in the listview.
SelectedRow	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearSelection	Clears the selection.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCellText	Returns the cell text.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnName	Returns the name of the column at the specified index.
GetColumnWidth	Returns the width of the specified column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from *IOracleFormsScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from *IOracleFormsScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsRowVisible	Returns whether the specified row is visible.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollToRow	Scrolls to the specified row.
SelectRow	Selects the specified row.
SetColumnWidth	Sets the width of the specified column.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsMenu Class

Description
Represents a top-level menu.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsMenu
    - *OracleFormsPopupMenu*

Syntax

```
'Declaration
Public Class OracleFormsMenu _
Inherits OracleFormsContainer _
Implements IOracleFormsMenuBase
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)

Name	Description
Checked	Whether the MenuItem is checked. (Inherited from *IOracleFormsMenuBase*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks a menu item
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsChecked	a value that indicates whether the MenuItem is checked.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects a menu item
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks a menu item
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsPopList Class

Description
Represents a PopList.

Inheritance Hierarchy

- *OracleFormsChoice*
  - OracleFormsPopList

Syntax

```
'Declaration
Public Class OracleFormsPopList _
Inherits OracleFormsChoice
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
DropDownOpen	whether the drop down is currently open.
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
ItemCount	the number of items in the choice. (Inherited from *OracleFormsChoice*)
Items	the list of choice items. (Inherited from *OracleFormsChoice*)
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from *OracleFormsChoice*)
SelectedItem	the selected item. (Inherited from *OracleFormsChoice*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)

Name	Description
GetItemText	Returns the item at the specified index. (Inherited from *OracleFormsChoice*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)

Name	Description
Select	Selects the specified item in the choice. (Inherited from *OracleFormsChoice*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsPopupMenu Class

Description
Represents a context menu.

Inheritance Hierarchy

- *OracleFormsMenu*
  - OracleFormsPopupMenu

Syntax

```
'Declaration
Public Class OracleFormsPopupMenu _
Inherits OracleFormsMenu
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Checked	Whether the MenuItem is checked. (Inherited from *IOracleFormsMenuBase*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks a menu item (Inherited from *OracleFormsMenu*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsChecked	a value that indicates whether the MenuItem is checked. (Inherited from *OracleFormsMenu*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects a menu item (Inherited from *OracleFormsMenu*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks a menu item (Inherited from *OracleFormsMenu*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsScrollbar Class

Description
Represents a scroll bar.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsScrollbar
    - *OracleFormsHorizontalScrollbar*
    - *OracleFormsVerticalScrollbar*

Syntax

```
'Declaration
Public Class OracleFormsScrollbar _
Inherits OracleFormsContainer _
Implements IOracleFormsScroller
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)

Name	Description
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Position	the current position of the scroll bar. (Inherited from *IOracleFormsScroller*)
Range	the range value of the scroll bar. (Inherited from *IOracleFormsScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)

Name	Description
Page	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScroller*)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScroller*)
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsStatusArea Class

Description
Represents the area containing status information.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsStatusArea

Syntax

```
'Declaration
Public Class OracleFormsStatusArea _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)

Name	Description
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsStatusBar Class

Description
Represents a status bar.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsStatusBar

Syntax

```
'Declaration
Public Class OracleFormsStatusBar _

FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetTabIndex	Returns the tab index.
GetTabTitle	Returns the tab title.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsTabEnabled	Returns whether or not the tab is currently enabled.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the specified tab.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsTabBarItem Class

Description
Represents a tab bar item.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTabBarItem

Syntax

```
'Declaration
Public Class OracleFormsTabBarItem _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
Select	Selects the tab.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)

Name	Description
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsTabPanel Class

Description
Represents a container class for components.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTabPanel

Syntax

```
'Declaration
Public Class OracleFormsTabPanel _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsTextField Class

Description
Represents an Oracle Forms text field.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTextField

Syntax

```
'Declaration
Public Class OracleFormsTextField _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
CaretPosition	the position of the text insertion caret for the text field.
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Editable	whether the text of the text field can be changed by the user.

Name	Description
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
IsPassword	whether the text field is a password text field.
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PasswordChar	the character that is displayed instead of the characters that are actually typed, if the text field is a password text field.
SelectedText	the current selected text.
SelectionEnd	the end position of the selected text.
SelectionStart	the start position of the selected text.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Clear	Removes all the text from the text field.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from *IOracleFormsScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from *IOracleFormsScrollable*)

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)

Name	Description
SelectAll	Selects all the text in the text field.
SetCaretPosition	Sets the position of the text insertion caret for this text field.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetSelectionRange	Selects the text within the specified range.
SetText	Sets the text of the text field to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsTitleBar Class

Description
Represents a title bar.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTitleBar

Syntax

```
'Declaration
Public Class OracleFormsTitleBar _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)

Name	Description
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsToolBar Class

Description
Represents a toolbar.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsToolBar

Syntax

```
'Declaration
Public Class OracleFormsToolBar _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. OracleFormsTree Class

Description
Represents a tree.

Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTree

Syntax

```
'Declaration
Public Class OracleFormsTree _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)

Name	Description
Height	The current height of the component. (Inherited from *AWTComponent*)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedItemPath	the list of selected item path.
SelectedItemText	the selected item text.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScrollable*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
ClickItem	Clicks on a tree node specified by the item path.

Name	Description
Collapse	Collapses the tree node identified by the specified item path.
CollapseAll	Collapses all tree nodes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleClickItem	Double-clicks on a tree node specified by the item path.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Expand	Expands the tree node identified by the specified item path.
ExpandAll	Expands all tree nodes.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from *IOracleFormsScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from *IOracleFormsScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)

Name	Description
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsExpanded	Returns 'true' if the specified item path is expanded.
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
IsVisible	Returns 'true' if the specified item path is visible.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollItemIntoView	Scrolls the given item path to a visible position.
Select	Selects a tree node identified by the specified item path.

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScrollable*)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScrollable*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

OracleFormsVerticalScrollbar Class

Description
Represents a vertical scroll bar.

Inheritance Hierarchy

- *OracleFormsScrollbar*
  - OracleFormsVerticalScrollbar

Syntax

```
'Declaration
Public Class OracleFormsVerticalScrollbar _
Inherits OracleFormsScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)

Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
PageSize	the block increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Position	the current position of the scroll bar. (Inherited from *IOracleFormsScroller*)
Range	the range value of the scroll bar. (Inherited from *IOracleFormsScroller*)
StepSize	the unit increment value of the scroll bar. (Inherited from *IOracleFormsScroller*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *AWTComponent*)
Page	Increments the current scroll position by specified number of pages. (Inherited from *IOracleFormsScroller*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from *AWTComponent*)
ScrollTo	Scrolls to the specified position. (Inherited from *IOracleFormsScroller*)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from *IOracleFormsScroller*)
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from *IOracleFormsScroller*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Step	Increments the current scroll position by specified steps. (Inherited from *IOracleFormsScroller*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

SplitPaneDivider Class

Description
Represents a split pane divider.

Inheritance Hierarchy

- *AWTContainer*
  - SplitPaneDivider

Syntax

```
'Declaration
Public Class SplitPaneDivider _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from *AWTComponent*)
AccessibleRole	The accessible role of the component. (Inherited from *AWTComponent*)
Background	The background color of the component. (Inherited from *AWTComponent*)
Cursor	The name of the cursor set in the component. (Inherited from *AWTComponent*)
Enabled	whether the component is enabled. (Inherited from *AWTComponent*)
Focusable	whether the component can be focused. (Inherited from *AWTComponent*)
Font	The font of the component. (Inherited from *AWTComponent*)

Name	Description
Foreground	The foreground color of the component. (Inherited from *AWTComponent*)
Height	The current height of the component. (Inherited from *AWTComponent*)
Name	The name of the component. (Inherited from *AWTComponent*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Width	The current width of the component. (Inherited from *AWTComponent*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Win32 Class Reference

Lists the available classes for testing Windows API-based controls.

AccessibleControl Class

Description

The class controls identified by the Accessibility extension.

Inheritance Hierarchy

- *BaseGuiTestObject*
  - AccessibleControl

Syntax

```
'Declaration
Public Class AccessibleControl _
Inherits BaseGuiTestObject
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Description	The description text of the accessible object.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Role	The role of this accessible object.
State	The state string that describes the different states of this accessible object.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoDefaultAction	Executes the default action of the underlying accessible control supports a default action.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

Name	Description
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Header Class

Description
The class for list header controls. Headers are most commonly used in controls of the ListViewW32 class.

Inheritance Hierarchy

- *Control*
  - Header

Syntax

```
'Declaration
Public Class Header _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
ColumnCount	The number of columns in the header.
ColumnOrder	The header's item indices as they are currently ordered.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DividerDoubleSelect	Double-clicks the divider on the right side of the specified item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Double-clicks an item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnTitle	Returns the title of a specified header item.
GetColumnWidth	Returns the width of a specified column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Resize	Resizes an item of the header.
Select	Selects an item or button.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ListView Class

Description

The class for elaborated list controls that support multiple ways of viewing a list of nonhierarchical data. These views include large and small rearrangable icons and a detail (or report) view.

Inheritance Hierarchy

- *Control*
  - ListView

Syntax

```
'Declaration
Public Class ListView _
Inherits Control
```

Properties

Name	Description
AllowsCheck	Whether this list view supports checking items.
AllowsMultiSelect	Whether the list view supports selecting multiple items.
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
CheckedIndices	A list containing the indices of the checked items.
CheckedItems	A list containing the checked items.

Name	Description
ColumnCount	The number of columns per item.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items contained in the list view.
Items	A list containing all items of the listview.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndices	A list containing the indices of the selected items.
SelectedItems	A list containing the selected items.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Checks an item.
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Double-clicks an item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExtendSelect	Selects a range of items by extending the selection in the extend-selection listview.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetContents	Returns the contents of a listview control. Each returned item is delimited by a semicolon. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetItemImageIndex	Returns the index into the image list of a list view that contains icons. This allows to verify that the correct image is used for an item.
GetItemIndex	Returns the index of the list view item or -1 if is not found.
GetItemRect	Returns rectangle of the item. If getIconRect is set then the rectangle of the icon of the item will be returned otherwise the rectangle of the item text is returned. If a columnIndex is specified the rectangle of this column is returned.
GetItemText	Returns the text of an item.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelect	Adds an item in the list to the set of currently selected items.
MultiUnselect	Removes an item in the list from the set of selected items.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetItemFocus	Gives focus to the item in the list.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks an item.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

MonthCalendar Class

Description
The class that selects the calendar date and time.

Inheritance Hierarchy

- *Control*
  - MonthCalendar

Syntax

```
'Declaration
Public Class MonthCalendar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExtendSelect	Selects a range of dates and times.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
OpenMonthMenu	Opens a calendar menu to a specific month.

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects a date and time.
SelectNextMonth	Selects the next month.
SelectPreviousMonth	Selects the previous month.
SelectToday	Selects the date for today.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Pager Class

Description

The class for tabbed, multi-page dialogs and for button bars. On Windows, this class corresponds to the TabControl control. On Windows, Silk Test only supports major tabs; it does not support minor tabs (also called 'subpages' or 'child pages').

Inheritance Hierarchy

- *Control*
  - Pager

Syntax

```
'Declaration
Public Class Pager _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Horizontal	Whether the up/down control is horizontal.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollDown	Moves the scroll bar down.
ScrollUp	Moves the scroll bar up.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

StatusBar Class

Description
The class for status bar controls. A status bar is a container for a set of text labels that change dynamically.

Inheritance Hierarchy

- *Control*
  - StatusBar

Syntax
```
'Declaration
Public Class StatusBar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

UpDown Class

Description
The class for up/down controls.

Inheritance Hierarchy

- *Control*
  - UpDown
    - *NumericUpDown*

Syntax

```
'Declaration
Public Class UpDown _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Horizontal	Whether the up/down control is horizontal.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	The position for the up/down control.
Range	The range of the up/down control.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Decrement	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Increment	Increases the position value of the up/down control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Windows Forms Class Reference

Lists the available classes for testing Windows Forms controls.

CheckedListBox Class

Description
CheckedListBox represents list boxes that contain a check box.

Inheritance Hierarchy

- *ListBox*
  - CheckedListBox

Syntax

```
'Declaration
Public Class CheckedListBox _
Inherits ListBox
```

Properties

Name	Description
AllowsMultiSelect	Whether the control supports selecting multiple items. (Inherited from *ListBox*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
CheckedIndices	The indices of the checked item(s).
CheckedItems	The names of the checked item(s).
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items in the list box. (Inherited from *ListBox*)
Items	A list of items in the list box. (Inherited from *ListBox*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	The index of the first selected item. (Inherited from *ListBox*)
SelectedIndices	The indices of the selected item(s). (Inherited from *ListBox*)
SelectedItem	The name of the first selected item. (Inherited from *ListBox*)
SelectedItems	The names of the selected item(s). (Inherited from *ListBox*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Check	Selects an item from the checked list box.
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelect	Double-clicks an item in the list box. (Inherited from *ListBox*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExtendSelect	Selects a range of items by extending the selection in the list box. (Inherited from *ListBox*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelect	Selects an item in the multi- or extend-selection list box. (Inherited from *ListBox*)
MultiUnselect	Unselects an item in the multi- or extend-selection list box. (Inherited from *ListBox*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects an item from the list box. (Inherited from *ListBox*)
SelectRange	Selects a range of items in the extend-selection list box. (Inherited from *ListBox*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Selects an item from the checked list box.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DataGrid Class

Description
The class for datagrids and data grid view.

Inheritance Hierarchy

- *Control*
  - DataGrid

Syntax

```
'Declaration
Public Class DataGrid _
Inherits Control
```

Properties

Name	Description
AllowsMultiSelect	Whether the table supports selecting multiple items.
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
ColumnCount	The number of columns in the DataGrid.
ColumnItems	A list of all items in the column.
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Items	A list of all items in the column.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
RowCount	The number of rows in the DataGrid.
RowItems	A list of all items in the row.
SelectedItems	The selected item(s).
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
DoubleSelectItem	Double-clicks an item.

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExtendSelectItem	Expands the selection to the given item.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelectItem	Adds a row from the table to the set of selected rows.
MultiUnselectItem	Removes a item from the set of selected items.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Tries to bring the item to the top left corner of the datagrid.
SelectAllItems	Selects all items in the datagrid.
SelectItem	Selects an item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)

Name	Description
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DataGridColumn Class

Description
The class for columns in a table.

Inheritance Hierarchy

- *Item*
  - DataGridColumn

Syntax
```
'Declaration
Public Class DataGridColumn _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)

Name	Description
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
Width	The width of the column.

Methods

Name	Description
AutoResize	Automatically resizes a column by double clicking its divider.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Resize	Resizes a column.

Name	Description
ScrollIntoView	Tries to bring the column to the left by scrolling the data grid.
Select	Selects a column.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DataGridItem Class

Description
The class for datagrids and data grid view rows.

Inheritance Hierarchy

- *Item*
  - DataGridItem

Syntax
```
'Declaration
Public Class DataGridItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Column	The column of the item in the data grid
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Row	The row of the item in the data grid
Selected	Whether the item is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Tries to bring the item to the top left corner of the datagrid.
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DataGridRow Class

Description
The class for rows in a table.

Inheritance Hierarchy

- *Item*
  - DataGridRow

Syntax

```
'Declaration
Public Class DataGridRow _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)

Name	Description
Height	The width of the column.
ItemCount	The number of items in the row.
Items	A list of items in the row.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Resize	Resizes a column.
ScrollIntoView	Tries to bring the row to the top by scrolling the data grid.

Name	Description
Select	Selects a column.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomainUpDown Class

Description
The class for up/down controls.

Inheritance Hierarchy

- *Control*
  - DomainUpDown

Syntax
```
'Declaration
Public Class DomainUpDown _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
ItemCount	The number of items contained in the list view.
Items	The items in the domain up/down control.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
SelectedIndex	The position for the up/down control.
SelectedItem	The position for the up/down control.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Decrement	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)

Name	Description
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Increment	Increases the position value of the up/down control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

ElementHost Class

Description
A Windows Forms control that can be used to host a Windows Presentation Foundation (WPF) element.

Inheritance Hierarchy

- *Control*
  - ElementHost

Syntax

```
'Declaration
Public Class ElementHost _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)

HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FormsHost Class

Description
An element that allows you to host a Windows Forms control on a WPF page.

Inheritance Hierarchy

- *Control*
  - FormsHost

Syntax
```
'Declaration
Public Class FormsHost _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

FormsWindow Class

Description
FormsWindow is the class that represents the top-level window of a Windows Forms application.

Inheritance Hierarchy
- *Window*
  - FormsWindow

Syntax
```
'Declaration
Public Class FormsWindow _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from *Window*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
LoadAssembly	Loads the assembly on the specified path in the Windows Forms application.
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SetActive	Makes the window active. (Inherited from *IMoveable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

MenuStrip Class

Description
MenuStrip is the class that creates a new menu strip for a Windows Forms application.

Inheritance Hierarchy

- *Control*
  - MenuStrip

Syntax

```
'Declaration
Public Class MenuStrip _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

NumericUpDown Class

Description
The class for numeric up/down controls.

Inheritance Hierarchy

- *UpDown*
  - NumericUpDown

Syntax

```
'Declaration
Public Class NumericUpDown _
Inherits UpDown
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
Horizontal	Whether the up/down control is horizontal. (Inherited from *UpDown*)
Maximum	The maximum value of the up/down control.
Minimum	The minimum value of the up/down control.
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Position	The position for the up/down control. (Inherited from *UpDown*)
PositionDecimal	The position for the up/down control.
Range	The range of the up/down control. (Inherited from *UpDown*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)

Name	Description
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum. (Inherited from *UpDown*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
Decrement	Decreases the position value of the up/down control. (Inherited from *UpDown*)
DecrementDecimal	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Increment	Increases the position value of the up/down control. (Inherited from *UpDown*)
IncrementDecimal	Increases the position value of the up/down control.
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

xBrowser Class Reference

Lists the available classes for testing xBrowser controls.

BrowserApplication Class

Description

Represents the top-level window of a browser application.

Note: `BrowserApplication` is derived from `BaseGuiTestObject` and inherits the two scrollbar methods `GetHorizontalBar` and `GetVerticalBar`. However, these two methods do not work on a `BrowserApplication`.

Inheritance Hierarchy

- *Window*
  - `BrowserApplication`

Syntax

```
'Declaration
Public Class BrowserApplication _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from *Window*)
Background	The background color of the GUI object. (Inherited from *GuiTestObject*)
Enabled	Whether the GUI object is enabled. (Inherited from *GuiTestObject*)
Font	The font type of the GUI object. (Inherited from *GuiTestObject*)
Foreground	The foreground color of the GUI object. (Inherited from *GuiTestObject*)
NativeHandle	The native window handle for the object. (Inherited from *INativeWindow*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *GuiTestObject*)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from *IMoveable*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearCache	Clears the browser's cache.
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Closes the window. (Inherited from *IMoveable*)
CloseOtherTabs	Closes all tabs except the active one. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. This method closes all other tabs except for the selected one, including the tabs that are not currently visible. This method is not supported for mobile Web applications.
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from *IMoveable*)
CloseTab	Closes the specified tab. If no tab is specified, the active tab is closed. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be closed. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
ExistsTab	Returns true if the tab exists and false otherwise. This method is not supported for mobile Web applications.
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetActiveTab	Returns the active tab. This method is not supported for mobile Web applications.

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from *IMoveable*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetFocus	Returns the object with the input focus. (Inherited from *IMoveable*)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from *IScrollable*)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from *IMoveable*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetSelectedTab	Returns the currently selected tab. This method is not supported for mobile Web applications.
GetSelectedTabIndex	Returns the index of the active tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the index relative to the currently visible tabs. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
GetSelectedTabName	Returns the name of the active tab. This method is not supported for mobile Web applications.
GetTabCount	Returns the number of open tabs. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the number of currently visible tabs. This method is not supported for mobile Web applications.
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from *IScrollable*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsActive	Returns whether the window is set to active. (Inherited from *IMoveable*)
IsFocused	Return whether the control has focus. (Inherited from *IFocusable*)
Maximize	Maximizes the window. (Inherited from *IMoveable*)
Minimize	Reduces the window to an icon. (Inherited from *IMoveable*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Move	Moves the window. (Inherited from *IMoveable*)
Navigate	Navigate to the specified URL in the currently active tab/window
OpenContextMenu	Opens a context menu at the specified position. (Inherited from *BaseGuiTestObject*)
OpenTab	Opens a new tab and navigates to the given URL. If no URL is given, the tab navigates to about:blank. This method is not supported for mobile Web applications.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Restore	Restores the window to its previous size. (Inherited from *IMoveable*)
SelectTab	Selects the specified tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be selected. Index 0 selects the first visible tab. This method is not supported for mobile Web applications.
SetActive	Makes the window active. (Inherited from *IMoveable*)

Name	Description
SetFocus	Gives focus to the control. (Inherited from *IFocusable*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Size	Resizes the window. (Inherited from *IMoveable*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

BrowserObject Class

Description
Base class for all objects that are contained within a BrowserApplication.

Inheritance Hierarchy

- *TestObject*
  - BrowserObject
    - *BrowserWindow*
    - *DomElement*

Syntax
```
'Declaration
Public Class BrowserObject _
Inherits TestObject _
Implements IClickable, IKeyable
```

Properties

Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
SetFocus	Gives focus to the control.
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

BrowserWindow Class

Description
A browser window is the top-level container for a web page. It exposes the DOM tree through DomElements. E.g. a tab in IE7, an embedded browser control in SWT.

Inheritance Hierarchy
- *BrowserObject*
  - BrowserWindow

Syntax
```
'Declaration
Public Class BrowserWindow _
Inherits BrowserObject
```

Properties
Name	Description
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
ViewportHeight	The height of the browser viewport
ViewportName	The name of the viewport that matches the innerWidth and innerHeight of the browser window
ViewportOrientation	The orientation of the browser viewport, this can be portrait or landscape
ViewportWidth	The width of the browser viewport
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods
Name	Description
AcceptAlert	Accepts a JavaScript alert by pressing OK.

Name	Description
Back	Goes back in the history.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
CaptureFullPageBitmap	Capture a screenshot of the whole web page and save it as a file to the specified path. The filename extension determines the file type. Possible extensions are .jpg, .jpeg, .png, and .bmp.
Click	Clicks on the object. (Inherited from *IClickable*)
Close	Close a modal browser dialog, a tab of the browser, or the browser itself if it is the last tab (or IE6).
DismissAlert	Dismisses a JavaScript alert.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates JavaScript code within the top-level document context.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
Forward	Goes forward in the history.
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetAlertText	Retrieves the message text of a JavaScript alert.
GetBrowserMajorVersion	Returns the browser's major version number.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of the BrowserWindow in HTML pixels. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser

Name	Description
	capable and your position calculations are not affected by changing zoom levels on mobile browsers.
GetPageSource	Returns the page source of the web site
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetUrl	Returns the URL for the main document.
GetUserAgent	Returns the browser's user agent string
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsAlertPresent	Returns true if a JavaScript alert is open
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Navigate	Navigates the main document to an URL.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
Reload	Reloads the main document as the reload button in the browser does.
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetViewportName	Set the size of the browser window to the specified size from your Browser Size list.
SetViewportSize	Sets the size of the browser window to the specified width and height.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomButton Class

Description

A DomButton represents all DOM elements that were specified using one of the following tags: <input type='submit'>, <input type='reset'>, <input type='button'> or <button>.

Inheritance Hierarchy

- *DomElement*
  - DomButton

Syntax

```
'Declaration
Public Class DomButton _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)

Name	Description
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position

Name	Description
	calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
Select	Clicks a button.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)

Name	Description
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomCheckBox Class

Description
A DomCheckBox represents all DOM elements that were specified using <input type='checkbox'> tag.

Inheritance Hierarchy

- *DomElement*
  - DomCheckBox

Syntax
```
'Declaration
Public Class DomCheckBox _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
State	The state of a check box. Values include: 1=checked,2=unchecked, 3=undecided
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)

Name	Description
Check	Checks the check box.
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by

Name	Description
	GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
IsChecked	Returns *true* if the checkbox is checked and *false* otherwise.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
Select	Selects the check box
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetUndecided	Sets the check box to the undecided state.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
Toggle	Toggles the state of the check box. If the checkbox is checked it is unchecked and vice versa. If the checkbox is in the undecided state it is left undecided.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Uncheck	Unchecks the check box.
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomElement Class

Description
A DomElement represents any element in the DOM tree.

Inheritance Hierarchy
- *BrowserObject*
  - DomElement
    - *DomButton*
    - *DomCheckBox*
    - *DomEmbeddedElement*
    - *DomForm*
    - *DomLink*
    - *DomListBox*
    - *DomRadioButton*
    - *DomTable*
    - *DomTableRow*
    - *DomTextField*

Syntax
```
'Declaration
Public Class DomElement _
Inherits BrowserObject
```

Properties
Name	Description
IsFocused	Whether the DOM element has focus.
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses.
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name.
GetDomAttribute	Gets the value of an object specific DOM attribute.
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers.
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element.
Highlight	Highlights a DOM element.
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window.
SetDomAttribute	Sets the value of an object specific DOM attribute.
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomEmbeddedElement Class

Description
A DOM element that was specified by an <embed> or <object> tag.

Inheritance Hierarchy

- *DomElement*
  - DomEmbeddedElement

Syntax
```
'Declaration
Public Class DomEmbeddedElement _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomForm Class

Description

A DomForm represents all DOM elements that were specified using the <form> tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- *DomElement*
  - DomForm

Syntax

```
'Declaration
Public Class DomForm _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)

Name	Description
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
Submit	Submits the form.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomLink Class

Description
A DomLink represents all DOM elements that were specified using the <a> tag.

Inheritance Hierarchy

- *DomElement*
  - DomLink

Syntax
```
'Declaration
Public Class DomLink _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)

Name	Description
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
Select	Clicks a link.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomListBox Class

Description
A DomListBox represents all DOM elements that were specified using the <select> tag.

Inheritance Hierarchy

- *DomElement*
  - DomListBox

Syntax
```
'Declaration
Public Class DomListBox _
Inherits DomElement
```

Properties

Name	Description
AllowsMultiSelect	whether the control is multiselectable.
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
ItemCount	the number of items in the listbox.
Items	the list of items in the listbox.
SelectedIndices	The indices of the selected item(s).
SelectedItems	The names of the selected item(s).
Text	The text of the control. (Inherited from *TestObject*)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
MultiSelect	Selects a list of items.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
Select	Selects an item.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)

Name	Description
Unselect	Unselects an item.
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomRadioButton Class

Description
A DomRadioButton represents all DOM elements that were specified using <input type='radio'> tag.

Inheritance Hierarchy

- *DomElement*
  - DomRadioButton

Syntax

```
'Declaration
Public Class DomRadioButton _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
RadioListItemCount	The number of items in the radiolist. This property is not supported for mobile Web applications.
RadioListItems	the list of items in the radio list
RadioListSelectedIndex	The index of the selected item. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
RadioListSelectedItem	The item that is selected in the radiolist. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
Selected	whether the radio button is selected.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
RadioListSelect	Selects an item in the radio list.
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
Select	Selects the radio button.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomTable Class

Description
A DomTable represents the <table> tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- *DomElement*
  - DomTable

Syntax
```
'Declaration
Public Class DomTable _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)

Name	Description
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCell	Returns the specified cell.
GetCellText	Returns the content of a cell element.
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetColumnCount	Number of columns of the table.
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected

Name	Description
	by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetRow	Returns the DOM element for the specified row.
GetRowCount	Returns the number of rows
GetRows	Returns a list of rows (DomTableRows)
GetRowText	Returns the content of all cell elements of a specified row.
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomTableRow Class

Description

A DomTableRow represents the <tr> tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- *DomElement*
  - DomTableRow

Syntax

```
'Declaration
Public Class DomTableRow _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from *TestObject*)
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetCell	Returns the DOM element in the given cell.
GetCellCount	Returns the number of cells in this table row
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)

DomTextField Class

Description

A DomTextField represents DOM elements that were specified using one of the following tags: <input type='text'>, <input type='password'>, <input type='file'> or <textarea>.

Inheritance Hierarchy

- *DomElement*
  - DomTextField

Syntax

```
'Declaration
Public Class DomTextField _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from *DomElement*)
IsPassword	whether the text field is a password text field.
Text	The text of the control. (Inherited from *TestObject*)
Value	The value of the control, e.g.: text in a text control. (Inherited from *TestObject*)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always *true*. However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from *BrowserObject*)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant *System.Drawing.Imaging.PixelFormat.Format32bppRgb* can be used for this purpose. (Inherited from *TestObject*)
ClearText	Clears the textfield's text
Click	Clicks on the object. (Inherited from *IClickable*)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from *DomElement*)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from *IClickable*)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from *DomElement*)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the *timeout* parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially *false* is returned immediately. (Inherited from *TestObject*)
Exists	Checks if an object exists in the application under test. (Inherited from *TestObject*)
Find	Finds an object specified by an XPath locator. (Inherited from *TestObject*)
FindAll	Finds all objects specified by an XPath locator. (Inherited from *TestObject*)
GenerateLocator	Returns a locator for this object. (Inherited from *TestObject*)
GetChildren	Returns the child objects of this object. (Inherited from *TestObject*)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from *DomElement*)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from *DomElement*)

Name	Description
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from *DomElement*)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from *TestObject*)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from *DomElement*)
GetParent	Looks up the parent of this object in the test application. (Inherited from *TestObject*)
GetProperty	Returns the value of the specified property. (Inherited from *TestObject*)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from *TestObject*)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from *TestObject*)
GetText	Gets the visible text of a DOM element. (Inherited from *DomElement*)
Highlight	Highlights a DOM element. (Inherited from *DomElement*)
HighlightObject	Highlights this object. (Inherited from *TestObject*)
ImageClick	Clicks on specified image asset. (Inherited from *TestObject*)
ImageClickFile	Clicks on the specified image. (Inherited from *TestObject*)
ImageExists	Returns whether the specified image asset exists. (Inherited from *TestObject*)
ImageExistsFile	Returns whether the specified image exists. (Inherited from *TestObject*)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from *TestObject*)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from *TestObject*)
Invoke	Dynamically invokes a method on the test object. (Inherited from *TestObject*)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from *TestObject*)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from *IKeyable*)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from *IKeyable*)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from *IClickable*)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from *DomElement*)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from *DomElement*)
SetFocus	Gives focus to the control. (Inherited from *BrowserObject*)
SetProperty	Sets the value of the specified property. (Inherited from *TestObject*)
SetText	Sets the text.
TextCapture	Returns the text in this object's visible area. (Inherited from *TestObject*)
TextClick	Clicks in the center of the specified text. (Inherited from *TestObject*)
TextExists	Returns whether the specified text exists. (Inherited from *TestObject*)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from *TestObject*)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from *IKeyable*)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from *IKeyable*)
Unhighlight	Restores the original foreground and background colors. (Inherited from *DomElement*)
Verify	Executes a verification on the given asset in the context of this UI object. (Inherited from *TestObject*)
WaitForChildDisappearance	Waits until the child object specified by the 'locator' parameter does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option *OPT_WAIT_RESOLVE_OBJDEF*. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from *TestObject*)
WaitForProperty	Waits until the property specified by the 'propertyName' parameter gets the value specified by the 'expectedValue' parameter or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from *TestObject*)
